DECLARATION OF CONFORMITY
GEN 5000W Series

We, TDK-Lambda Americas Inc., of 405 Essex Road, Neptune, NJ 07753, USA declare under our sole responsibility that the GEN 5000W series as detailed on the attached products covered sheet comply with the provisions of the following European Directives and are eligible to bear the CE mark:

Low Voltage Directive  
EMC Directive  
RoHS 2

Directive 2014/35/EU  
Directive 2014/30/EU  
Directive 2011/65/EU

Assurance of conformance of the described product with the provisions of the stated EC Directive is given through compliance to the following standards:

Electrical Safety (LVD):  
Electromagnetic Compatibility (EMC):

EN60950-1:2006 + A2:2013  

Further, all products covered by this declaration are manufactured in accordance with ISO9000:2008.

PRODUCTS COVERED SHEET FOR THE GEN 5000W SERIES

Product Name: GEN 5000W Series Switch Mode DC Power Supply

Models: \[\text{GEN www-xxx-yyyy-u-zzzzz-zu}\]

\text{www=} \text{Volts (8V to 600V)}
\text{xxx=} \text{Current (8.5A to 600A depending on power not to exceed 5100W)}
\text{yyy=} \text{LAN, MD, IEEE, IEMD, IS420, IS510, USB}
\text{zzzzz=} \text{3P208 for 208Vac 3 phase input or 3P400 for 400Vac 3 phase input}
\text{u=} \text{optional power cord.}

May be followed by optional suffix indicating changes not affecting safety or EMC.
Supplement Manuals for Options:

For units equipped with the “IEMD” option, for IEEE-488 with Multi-drop, also refer to IEMD manual 83030200

For units equipped with the “LAN” option for Local Area Network with Multi-drop, also refer to LAN manual 83034100

For units equipped with “MD” option, for Multi-drop, also refer to the respective IEMD or LAN manuals

WARRANTY
This TDK-Lambda Americas Inc. product is warranted against defects in materials and workmanship for a period of five years from date of shipment. During the warranty period, TDK-Lambda Americas Inc. will, at its option, either repair or replace products which prove to be defective.

LIMITATION OF WARRANTY
The warranty shall not apply to defects resulting from improper or inadequate usage or maintenance by the buyer, buyer supplied products or interfacing. The warranty shall not apply to defects resulting from unauthorized modifications, or from operation exceeding the environmental specifications of the product, or if the QA seal has been removed or altered by anyone other than TDK-Lambda Americas Inc. authorized personnel. TDK-Lambda Americas Inc. does not warrant the buyer’s circuitry or malfunctions of TDK-Lambda Americas Inc. products resulting from the buyer’s circuitry. Furthermore, TDK-Lambda Americas Inc. does not warrant any damage occurring as a result of the buyer’s circuitry or the buyer’s supplied products. THIS LIMITED WARRANTY IS IN LIEU OF, AND TDK-LAMBDA AMERICAS INC DISCLAIMS AND EXCLUDES, ALL OTHER WARRANTIES, STATUTORY, EXPRESS OR IMPLIED, INCLUDING, WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, OR OF CONFORMITY TO MODELS OR SAMPLES.

WARRANTY SERVICE
This product must be returned to an authorized TDK-Lambda Americas Inc. service facility for repairs or other warranty service. For products returned to TDK-Lambda Americas Inc. for warranty service, the buyer shall prepay shipping charges to TDK-Lambda Americas Inc. If the unit is covered under the foregoing warranty then TDK-Lambda Americas Inc. shall pay the shipping charges to return the product to the buyer. Refer to Section 3.11 for repackaging for shipment.

DISCLAIMER
The information contained in this document is subject to change without notice. TDK-Lambda Americas Inc. shall not be liable for errors contained in this document or for incidental or consequential damages in connection with the furnishing, performance or use of this material. No part of this document may be photocopied, reproduced or translated into another language without the prior written consent of TDK-Lambda Americas Inc.

TRADEMARK INFORMATION
Genesys™ power supply is a trademark of TDK-Lambda Americas Inc. Microsoft™ and Windows™ are trademarks of Microsoft Corporation.

THE FCC WANTS YOU TO KNOW
This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment.

This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications.

Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

FCC WARNING
Modifications not expressly approved by manufacturer could void the user authority to operate the equipment under FCC Rules.
SAFETY INSTRUCTIONS

CAUTION
The following safety precaution must be observed during all phases of operation, service and repair of this equipment. Failure to comply with the safety precautions or warnings in this document violates safety standards of design, manufacture and intended use of this equipment and may impair the built-in protections within.
TDK-Lambda Americas Inc. shall not be liable for user's failure to comply with these requirements.

INSTALLATION CATEGORY
The Genesys™ power supply series has been evaluated to INSTALLATION CATEGORY II.
Installation category (over voltage category) II: local level, appliances, portable equipment etc. With smaller transient over voltage than Installation Category (over voltage category) III.

GROUNDING
This product is a Safety Class 1 instrument. To minimize shock hazard, the instrument chassis must be connected to an electrical ground. The instrument must be connected to the AC power supply mains through a three conductor power cable, with the ground wire firmly connected to an electrical ground (safety ground) at the power outlet.

For instruments designed to be hard-wired to the supply mains, the protective earth terminal must be connected to the safety electrical ground before another connection is made. Any interruption of the protective ground conductor or disconnection of the protective earth terminal will cause a potential shock hazard that might cause personal injury.

WARNING
OUTPUT TERMINALS GROUNDING
There is a potential shock hazard at the RS232/RS485/LAN and the IEEE ports when using power supplies with rated or combined voltage greater than 400V and the Positive Output of the Power Supply is grounded.
Do Not connect the Positive Output to ground when using the RS232/RS485/LAN or IEEE.

FUSES
Fuses must be changed by authorized TDK-Lambda Americas Inc. service personnel only. For continued protection against risk of fire, replace only with the same type and rating of fuse.

INPUT RATINGS
Do not use AC supply, which exceeds the input voltage and frequency rating of this instrument. The input voltage and frequency rating of the Genesys™ power supply series has two input ranges depending on the model type ordered. Ranges are 190-253 Vac/380-415 Vac/432-528 Vac, 50-60Hz. For safety reasons, the mains supply voltage fluctuations should not exceed above voltage range.

LIVE CIRCUITS
Operating personnel must not remove the instrument cover. No internal adjustment or component replacement is allowed by non-TDK-Lambda Americas Inc. qualified personnel. Never replace components with power cable connected. To avoid injuries, always disconnect power, discharge circuits and remove external voltage source before touching components.
## PARTS SUBSTITUTIONS & MODIFICATIONS

Parts substitutions and modifications are allowed by authorized TDK-Lambda Americas Inc. service personnel only. For repairs or modifications, the instrument must be returned to an authorized TDK-Lambda Americas Inc. service facility.

## SAFETY INSTRUCTIONS

### ENVIRONMENTAL CONDITIONS

The Genesys™ power supply series safety approval applies to the following operating conditions:

- Indoor use
- Ambient temperature: 0°C to 50°C
- Maximum relative humidity: 90% (no condensation)
- Altitude: up to 3000m
- Pollution degree 2

FCC COMPLIANCE NOTICE:

Note: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.
CONSIGNES DE SECURITE

ATTENTION
Les consignes de sécurité suivantes doivent être observées pendant toutes les phases de l'utilisation, entretien et réparations de cet équipement. Le non-respect des consignes de sécurité et des avertissements dans ce document viole les normes sécurité de conception, fabrication et utilisation prévue de cet équipement et peut compromettre les protections incorporées en lui. TDK-Lambda Americas Inc. ne sera pas responsable des conséquences si l'utilisateur ne respecte pas ces consignes.

CATEGORIE D'INSTALLATION
Les alimentations Genesys™ ont été classées dans CATEGORIE INSTALLATION II. Catégorie installation (catégorie surtension) II : utilisation locale, appareils, équipement portable, etc. Avec des surtensions transitoires plus faibles que celles de la catégorie installation (catégorie surtension) III.

MISE A LA TERRE
Ce produit est un instrument Classe 1 Sécurité. Pour minimiser le risque de choc électrique, son châssis doit être raccordé à une terre électrique. L'instrument doit être raccordé à l'alimentation principale AC par un câble à trois conducteurs, le conducteur de terre étant raccordé à une terre électrique (terre sécurité) sur la prise électrique.

Pour les instruments conçus pour être raccordés à l'alimentation électrique principale, la borne de terre doit être raccordée à la terre électrique de sécurité avant d'établir une autre connexion. Si le conducteur de terre est coupé ou si la borne de terre est débranchée, il y a un risque de choc électrique pouvant provoquer des blessures.

FUSIBLES
Les fusibles ne doivent être remplacés que par des techniciens d'entretien agr éés TDK-Lambda Americas Inc. Pour assurer une protection continue contre le risque d'incendie, remplacez les fusibles par des fusibles de même type et de même capacité.

ALIMENTATION PRINCIPALE
N'utilisez pas une alimentation AC dont la tension et la fréquence dépassent les valeurs nominales de cet instrument. La tension d'entrée et la fréquence nominale de la Genesys™ alimentation série a trois plages d'entrée selon le type de modèle commandé. Les intervalles sont 190-253 Vac/380-415 Vac/432-528 Vac, 50-60Hz. Pour des raisons de sécurité, la tension d'alimentation principale ne doit pas fluctuer en dehors des intervalles ci-dessus.
CIRCUITS SOUS TENSION
Le personnel d'exploitation ne doit pas enlever le couvercle de l'instrument. Le réglage ou le remplacement des composants internes ne peut être effectué que par un personnel qualifié TDK-Lambda Americas Inc. Ne remplacez jamais les composants lorsque le câble d'alimentation est connecté. Pour éviter les blessures, débranchez toujours l'alimentation, déchargez les circuits et retirez la source de tension extérieure avant de toucher les composants.

SUBSTITUTIONS ET MODIFICATIONS DE PIECES
Les substitutions et modifications de pièces ne peuvent être effectuées que par les techniciens d'entretien agréés TDK-Lambda Americas Inc. Pour les réparations ou les modifications, l'instrument doit être renvoyé à un centre d'entretien agréé TDK-Lambda Americas Inc.

CONSIGNES DE SECURITE
CONDITIONS ENVIRONNEMENTALES
L'approbation sécurité des alimentations Genesys™ s'applique aux conditions opératoires suivantes :
*Utilisation en intérieur
*Température ambiante : 0°C à 50°C
*Humidité relative maximum : 90 % (sans condensation)
*Altitude : 3000 m maximum
*Pollution degré 2

NOTE CONCERNANT LA CONFORMITE FCC :
Nota : Cet équipement a été testé et s'est avéré conforme aux limites pour un appareil numérique Classe A selon la part 15 des règles FCC. Ces limites sont conçues pour assurer une protection raisonnable contre les interférences dangereuses lorsque l'équipement est utilisé dans un environnement commercial. Cet équipement génère, utilise et peut rayonner des fréquences radio et, s'il n'est pas installé et utilisé conformément au manuel d'instructions, il peut provoquer des interférences dangereuses pour les communications radio. L'utilisation de cet équipement dans une zone résidentielle provoquera probablement des interférences nocives, et dans ce cas l'utilisateur doit prendre des mesures pour les supprimer à ses propres frais.
SICHERHEITSVORSCHRIFTEN

VORSICHT

TDK-Lambda Americas Inc. ist nicht haftbar für Schäden, die durch Missachtung dieser Sicherheitsvorschriften entstehen können.

INSTALLATIONSKATEGORIE
Die Genesys™ Reihe der Netzgeräte wurde in die INSTALLATIONSKATEGORIE II eingeteilt. Installationskategorie (Überspannungskategorie) II: die lokale Ebene, Geräte, tragbare Anlagen, etc. mit kleineren vorübergehenden Überspannungen als die Installationskategorie (Überspannungskategorie) III.

ERDUNGSKONZEPT

Bei Festverdrahtung der Geräte ist sicherzustellen, dass der PE-Anschluss an die elektrische Schutzerde angeklemmt wird, bevor das Gerät an die Stromversorgung angeschlossen wird. Jede Unterbrechung des PE-Leiters oder die Trennung der PE-Verbindung kann einen möglichen elektrischen Schlag hervorrufen, der Personenschäden zur Folge haben kann.

NORME DI SICUREZZA

ATTENZIONE
La seguente precauzione di sicurezza deve essere osservata a tutti gli stadi del funzionamento, della manutenzione e della riparazione di questa apparecchiatura. L'inosservanza delle precauzioni o delle avvertenze di sicurezza contenute in questo documento viola gli standard di sicurezza della progettazione, della produzione e dell'uso previsto di questa apparecchiatura, e può compromettere i dispositivi di protezione in essa incorporati.

TDK-Lambda Americas Inc. non si assume alcuna responsabilità per il mancato rispetto di questi requisiti da parte dell'utente.

CATEGORIA DI INSTALLAZIONE
La serie di alimentatori Genesys™ è stata valutata e risulta conforme alla CATEGORIA DI INSTALLAZIONE II. Categoria di installazione (categoria di sovratensione) II: livello locale, elettrodomestici, apparecchiature portatili ecc. Con sovratensioni transitorie inferiori alla Categoria di installazione (categoria di sovratensione) III.

MESSA A TERRA
Questo prodotto è uno strumento di Classe di sicurezza 1. Per minimizzare il pericolo di scosse elettriche, il telaio dello strumento deve essere collegato a una terra elettrica. Lo strumento deve essere collegato alla rete di alimentazione a CA mediante un cavo a tre conduttori, con il filo di terra ben collegato a una terra elettrica (terra di sicurezza) in corrispondenza della presa di corrente.

Per strumenti progettati per il cablaggio alla rete di alimentazione, il terminale protettivo di terra va collegato alla terra elettrica di sicurezza prima di procedere ad altri collegamenti. Eventuali interruzioni del conduttore protettivo di terra, o scollegamenti del terminale protettivo di terra, porteranno al rischio di scossa elettrica e di conseguente potenziale infortunio.

AVVERTENZA

MESSA A TERRA DEI TERMINALI DI USCITA

Vi è rischio di scossa elettrica in corrispondenza delle porte RS232/RS485/LAN e IEEE se si utilizzano alimentatori con tensione nominale o combinata oltre 400 V e con l'Uscita positiva dell'alimentatore messa a terra.

Non collegare alla terra l'Uscita positiva quando si usano le porte RS232/RS485/LAN o IEEE.

FUSIBILI
I fusibili devono essere sostituiti unicamente da addetti autorizzati di TDK-Lambda Americas Inc. Per una protezione continua dal rischio di incendi, sostituire sono con fusibili di tipo e di potenza nominale identici.

POTENZE NOMINALI IN INGRESSO
Non usare un'alimentazione a CA che superi la tensione in ingresso e la potenza nominale di frequenza di questo strumento. La tensione di ingresso e la frequenza di alimentazione serie Genesys™ ha tre campi di ingresso a seconda del modello ordinato. Le bande sono: 190-253
Vac/380-415 Vac/432-528 Vac, 50-60Hz. Per ragioni di sicurezza, eventuali fluttuazioni nella tensione di rete non devono superare il campo di potenze nominali suddetto.

CIRCUITI SOTTO TENSIONE
Nessun addetto deve mai rimuovere il coperchio dello strumento. Le regolazioni interne e la sostituzione dei componenti sono consentite unicamente al personale qualificato di TDK-Lambda Americas Inc. Non sostituire mai un componente con il cavo elettrico ancora collegato. A prevenzione degli infortuni, staccare sempre la corrente, scaricare i circuiti e scollegare le fonti di tensione esterne prima di toccare i componenti.

SOSTITUZIONI E MODIFICHE DEI COMPONENTI
I componenti devono essere sostituiti o modificati unicamente da addetti autorizzati di TDK-Lambda Americas Inc. Per riparazioni o modifiche, restituire lo strumento al centro assistenza di TDK-Lambda Americas Inc.

NORME DI SICUREZZA
CONDIZIONI AMBIENTALI
L'approvazione della sicurezza della serie di alimentatori Genesys™ è valida in presenza delle condizioni d'uso seguenti:
* Uso in interni
* Temperatura ambiente: 0 ºC - 50 ºC
* Umidità relativa massima: 90% (zero condensa)
* Altitudine: fino a 3000 m
* Inquinamento grado 2

| **WARNING** | Il simbolo di AVVERTIMENTO denota un periodo. È necessario prestare attenzione alla procedura.  
Il mancato rispetto della procedura può sfociare in un infortunio.  
Non ignorare alcun simbolo di AVVERTIMENTO. Tutte le condizioni indicate devono essere pienamente comprese e rispettate. |
| **CAUTION** | Il simbolo di ATTENZIONE denota un pericolo. È necessario prestare attenzione alla procedura. Il mancato rispetto della procedura può sfociare in danni per l'apparecchiatura. Non procedere oltre un simbolo di ATTENZIONE senza prima avere pienamente compreso e rispettato tutte le condizioni indicate. |
| **AVVISO DI CONFORMITÀ FCC:** | NB: Questa apparecchiatura è stata testata ed è risultata conforme ai limiti per i dispositivi digitali di Classe A, ai sensi della parte 15 dei Regolamenti FCC. Tali limiti sono formulati per offrire ragionevole protezione dalle interferenze pericolose quando l'apparecchiatura viene azionata in ambienti commerciali. Questa apparecchiatura genera, usa e può irradiare energia a radiofrequenza; se non viene installata ed utilizzata attenendosi al manuale delle istruzioni, può causare interferenze pericolose per le radiocomunicazioni. È probabile che l'uso di questa apparecchiatura in zone residenziali provochi interferenze pericolose. In tal caso, l'utente dovrà rettificare a proprie spese tali interferenze. |
PORTUGUÊS

INSTRUÇÕES DE SEGURANÇA

CUIDADO

As seguintes precauções de segurança devem ser respeitadas em todas as fases de funcionamento, assistência e reparação deste equipamento. A não observância dos avisos e precauções de segurança constantes neste documento viola os padrões de segurança da concepção, fabrico e utilização pretendida deste equipamento, podendo danificar as protecções integradas no seu interior. A TDK-Lambda Americas Inc. não poderá ser responsabilizada pelo não cumprimento destes requisitos por parte do utilizador.

CATEGORIA DA INSTALAÇÃO

A série Genesys™ de fontes de alimentação foi avaliada como sendo uma INSTALAÇÃO DA CATEGORIA II. Categoria da instalação (categoria de sobretensão) II: nível local, instrumentos, equipamento portátil, etc. Com uma sobretensão transitória provisória inferior à das instalações da categoria (categoria de sobretensão) III.

LIGAÇÃO À TERRA

Este produto é um instrumento de Classe de Segurança 1. Para reduzir o risco de choque, o chassi do instrumento deve ter ligação de terra. O instrumento deve ser ligado à fonte de alimentação de corrente alternada através de um cabo de alimentação de três condutores, com o fio de terra firmemente ligado a uma ligação de terra (sistemas de segurança por ligação à terra) na tomada de alimentação.

Em instrumentos concebidos para serem ligados à fonte de alimentação através de cabos, o terminal de terra de protecção deve ser ligado ao sistema eléctrico de segurança por ligação à terra antes de se realizar qualquer outra ligação. Qualquer interrupção do condutor de terra de protecção ou corte do terminal de terra de protecção poderá originar um risco de choque passível de provocar ferimentos.

AVISO

LIGAÇÃO À TERRA DE TERMINAIS DE SAÍDA

Há a possibilidade de existir risco de choque nas portas RS232/RS485/LAN e IEEE quando se utilizam fontes de alimentação com tensão nominal ou combinada superior a 400 V e a saída positiva da fonte de alimentação está ligada à terra. **Não ligue a saída positiva à terra quando utilizar as portas RS232/RS485/LAN ou IEEE.**

FUSÍVEIS

Os fusíveis apenas devem ser substituídos por pessoal de assistência autorizado da TDK-Lambda Americas Inc. Para obter uma protecção contínua contra o risco de incêndios, substitua sempre os fusíveis por outros do mesmo tipo e classificação.

CLASSIFICAÇÃO DAS ENTRADAS

Não utilize fontes de alimentação de corrente alternada que excedam a tensão de entrada e a classificação de frequência deste instrumento. A frequência e tensão de entrada nominal da série Genesys™ fonte de alimentação entrada tem três faixas dependendo do modelo adquirido. As gamas
são: 190-253 Vac/380-415 Vac/432-528 Vac, 50-60Hz. Por motivos de segurança, as flutuações da tensão da fonte de alimentação não devem exceder a gama da tensão superior.

**CIRCUITOS SOB TENSÃO**
Os operadores não devem retirar a cobertura do instrumento. A realização de ajustes internos ou substituições de componentes só é permitida se realizada por pessoal especializado da TDK-Lambda Americas Inc. Nunca substitua componentes com o cabo de alimentação ligado. Para evitar ferimentos, desligue sempre a energia, descarregue os circuitos e desligue a fonte de tensão externa antes de tocar nos componentes.

**MODIFICAÇÕES E SUBSTITUIÇÕES DE PEÇAS**
As modificações e substituições de peças apenas são permitidas quando realizadas pelo pessoal de assistência da TDK-Lambda Americas Inc. Para a realização de reparações ou modificações, é necessário devolver o instrumento a uma unidade de serviço autorizada da TDK-Lambda Americas Inc.

**INSTRUÇÕES DE SEGURANÇA**

**CONDIÇÕES AMBIENTAIS**
A aprovação de segurança das fontes de alimentação da série Genesys™ aplica-se às seguintes condições de funcionamento:

*Utilização no interior*  
*Temperatura ambiente: De 0 °C a 50 °C*  
*Humidade relativa máxima: 90% (sem condensação)*  
*Altitude: até 3000 m*  
*Nível de poluição 2*

INSTRUCCIONES DE SEGURIDAD

PRECAUCIÓN
La siguiente precaución de seguridad debe ser respetada durante todas las fases de funcionamiento, mantenimiento y reparación de este equipo. El incumplimiento de las precauciones o advertencias de seguridad recogidas en este documento infringe las normativas de seguridad de diseño, fabricación y uso previsto de este equipo y puede afectar a las protecciones incorporadas en el mismo. TDK-Lambda Americas Inc. no asumirá responsabilidad alguna si el usuario no cumple estos requisitos.

CATEGORÍA DE INSTALACIÓN
La serie de fuentes de alimentación Genesys™ ha sido evaluada conforme a la CATEGORÍA DE INSTALACIÓN II. Categoría de instalación (categoría de sobretensión) II: equipos de nivel local, eléctricos, portátiles, etc. Con una sobretensión transitoria menor que la Categoría de Instalación (categoría de sobretensión) III.

CONEXIÓN A TIERRA
Este producto es un aparato de Seguridad de Clase 1. Para minimizar el riesgo de descargas, el chasis del aparato se debe conectar a una toma de tierra eléctrica. El aparato se debe conectar a la toma de energía eléctrica de corriente alterna de la red de distribución a través de un cable de alimentación de tres conductores, con el conductor de tierra firmemente conectado a una toma de tierra eléctrica (toma de tierra de seguridad) de la toma de corriente.

En el caso de aquellos aparatos diseñados para quedar cableados a la red de alimentación, el borne de tierra de protección se debe conectar a la toma de tierra eléctrica de seguridad antes de establecer cualquier otra conexión. Cualquier interrupción del conductor de tierra de protección o desconexión del borne de tierra de protección supondrá un riesgo potencial de descarga eléctrica que puede llegar a causar daños personales.

FUSIBLES
Los fusibles sólo pueden ser cambiados por el personal de servicio autorizado de TDK-Lambda Americas Inc. Para una protección permanente contra el peligro de incendios, utilice únicamente fusibles del mismo tipo y de la misma potencia nominal.

POTENCIAS NOMINALES DE ENTRADA
No utilice fuentes de alimentación de CA cuyos valores nominales superen los de la tensión y frecuencia de entrada de este aparato. El voltaje y la frecuencia de entrada de la fuente de alimentación serie Genesys™ tiene tres márgenes de entrada dependiendo del tipo de modelo.
rangos son 190-253 Vac/380-415 Vac/432-528 Vac, 50-60Hz. Por razones de seguridad, las fluctuaciones en la tensión de alimentación de la red no deberían superar los rangos de tensión antedichos.

CIRCUITOS ACTIVOS
El personal operativo no debe retirar la cubierta del aparato. Los ajustes internos o el reemplazo de componentes sólo pueden ser realizados por el personal cualificado de TDK-Lambda Americas Inc. Desenchufe siempre el cable de alimentación antes de reemplazar los componentes. Para evitar lesiones, desenchufe siempre el cable de alimentación, descargue los circuitos y desconecte la fuente de tensión externa antes de tocar los componentes.

SUSTITUCIÓN Y MODIFICACIÓN DE LAS PIEZAS
Las piezas sólo pueden ser sustituidas o modificadas por el personal de servicio autorizado de TDK-Lambda Americas Inc. Para cualquier reparación o modificación del aparato, éste debe ser enviado a un centro de servicio autorizado de TDK-Lambda Americas Inc.

INSTRUCCIONES DE SEGURIDAD
CONDICIONES MEDIOAMBIENTALES
La aprobación de seguridad de la serie de fuentes de alimentación Genesys™ es aplicable a las siguientes condiciones de funcionamiento:

*Uso en interiores
*Temperatura ambiente: 0°C a 50°C
*Humedad relativa máxima: 90% (sin condensación)
*Altitud: hasta 3000 m
*Grado de contaminación 2

**DECLARACIÓN DE CONFORMIDAD CON LA FCC:**

Nota: Este equipo ha sido ensayado y cumple con los límites establecidos para los dispositivos digitales de Clase A, de conformidad con lo dispuesto en el Apartado 15 de la normativa de la FCC. Estos límites han sido diseñados para proporcionar una protección razonable contra interferencias perjudiciales cuando el equipo se utilice en entornos comerciales. Este equipo genera, usa y puede emitir energía de radiofrecuencia y, si no se instala y utiliza de acuerdo con el manual de instrucciones, puede ocasionar interferencias perjudiciales con las comunicaciones por radio. La utilización de este equipo en un área residencial puede llegar a provocar interferencias perjudiciales, en cuyo se le pedirá al usuario que las corrija y que se haga cargo del gasto generado.
1. General Information

1.1. User Manual Content

This User’s Manual contains the operating instructions, installation instructions and specifications of the Genesys™ 5000W power supply series. The instructions refer to the standard power supplies, including the built-in RS232/RS485 serial communication. For information related to operation with the optional IEEE programming, refer to User Manual for Power Supply IEEE Programming Interface.

1.2. Introduction

1.2.1. General Description

Genesys™ power supplies are wide output range, high performance switching power supplies. The Genesys™ series is power factor corrected and operates from AC voltage range of 190-240VAC three phase for 200V models and 380-415VAC three phase for 400VAC and 428-532VAC three phase for 480VAC models. Output Voltage and Current are continuously displayed and LED indicators show the complete operating status of the power supply. The Front panel controls allow the user to set the output parameters, the protections levels (Over-Voltage protection, Under-Voltage limit and Foldback) and preview the settings. The rear panel includes the necessary connectors to control and monitor the power supply operation by remote analog signals or by the built-in serial communication (RS232/RS485). GPIB programming, LXI certified LAN and Isolated-Analog programming/monitoring are optional.

1.2.2. Models Covered by this Manual

Models with rated output from 0-8VDC/0-600A to 0-600VDC/0-8.5A.

1.2.3. Features and Options

- Constant Voltage / Constant Current with automatic crossover.
- Active power factor correction.
- Embedded Microprocessor Controller.
- Built-in RS232/RS485 Interface.
- Voltage & Current high resolution adjustment by digital encoders.
- High accuracy programming/readback-16 bit.
- Software Calibration (no internal trimmers / potentiometers).
- Last Setting Memory.
• Independent Remote ON/OFF (opto-isolated) and remote Enable/Disable.
• Parallel operation (Master/Slave) with Active current sharing.
• Remote sensing to compensate for voltage drop of power leads.
• External Analog Programming and Monitoring standard (0-5V or 0-10V, user selectable).
• Cooling fan speed control for low noise and extended fan life.
• Zero stacking-no ventilation holes at the top and bottom surface of the power supply.
• Optional LAN and GPIB interfaces (SCPI compatible).
• Optional Isolated Analog programming/monitoring (0-5V or 0-10V, user selectable and 4-20mA).

1.2.4. Multiple Output Power System

The Genesys™ power supplies series can be configured into a programmable power system of up to 31 units using the built-in RS232/RS485 communication port and the RS485 linking cable provided with each power supply.

In a GPIB system, each power supply can be controlled using the optional GPIB controller (factory installed).

1.2.5. Control via the Serial Communication Port

The following parameters can be programmed and monitored via the serial communication port:

a) Output Voltage setting.
b) Output Current setting.
c) Output Voltage measurement.
d) Output On/Off control.
e) Output Current measurement.
f) Foldback protection setting
g) Over-voltage protection setting and readback.
h) Under-Voltage limit setting and readback.
i) Power-supply start up mode (last setting or safe mode).

1.2.6. Analog Voltage Programming and Monitoring

Analog inputs and outputs are provided at the rear panel for analog control of the power supply. The Output Voltage and the Current can be programmed by analog voltage or by resistor, and can be monitored by analog voltage. The power supply output can be remotely set to On or Off and analog signals monitor the proper operation of the power supply and the mode of operation (CV/CC).

1.2.7. Parallel Operation

Genesys™ power supplies of the same Output Voltage and Current rating can be paralleled in a master-slave configuration with automatic current sharing to increase power available.
1.2.8. Output Connections

Output connections are made to rear panel bus-bars for models up to 100V and to a 4-terminal wire clamp connector for models above 100V rated output voltage. Either the positive or negative terminal may be grounded or the output may be floated. Models up to 60VDC Rated Output shall not float outputs more than +/- 60VDC above/below chassis ground. Models >60VDC Rated Output shall not float outputs more than +/- 600VDC above/below chassis ground. Contact factory for assistance with higher float voltage applications.

Local or remote sense may be used. In remote sense, the voltage drop on the load wires should be minimized. Refer to the specifications for the maximum voltage drop value.

CAUTION
Observe all torque guidelines within this manual. Over-torquing may damage Unit or accessories. Such damage is not covered under manufacturer's warranty.

1.2.9. Cooling and Mechanical Construction

The Genesys™ series is cooled by internal fans. At the installation, care must be taken to allow free airflow into the power supply via the front panel and out of the power supply via the rear panel. The Genesys™ power supplies have a compact and lightweight package, which allows easy installation and space saving in the application equipment.

1.3. Accessories

1.3.1. General

Accessories are delivered with the power supply or separately upon ordering. The list below shows the possible accessories and ordering numbers.

1.3.2. Serial Link Cable

Serial link cable, for linking power supplies by RS485 communication is provided with the power supply.

Cable description: 0.5m length, shielded, RJ-45 type plugs, 8 contacts (P/N:GEN/RJ-45).

1.3.3. Hardware (Delivered with Power Supply)

- DB25 plug (AMP, 749809-9).
- Strain relief for AC cord.
- Output terminal shield.
- Output bus bar connection hardware.
- Plastic legs for bench mounting.

1.3.4. AC Cables

AC cables are not provided with the power supply.

Refer to Table 1-1 for recommended AC input cables (customer supplied). Add a non-locking plug approved by the national safety standards of the county of usage.

2.6 PROGRAMMING AND READBACK (RS232/485, Optional IEEE Interface)

1. Vout programming accuracy – 0.1% of rated output voltage
2. Iout programming accuracy(13) – 0.1% of actual output current + 0.3% of rated output current
3. Vout programming resolution – 0.012% of full scale
4. Iout programming resolution – 0.012% of full scale
5. Vout readback accuracy – 0.15% of rated output voltage
6. Iout readback accuracy(13) – 0.4% of rated output current
7. Vout readback resolution – 0.012% of full scale
8. Iout readback resolution – 0.012% of full scale

2.7 PROTECTIVE FUNCTIONS

1. Foldback protection – Output shut-down when power supply change from CV to CC User presettable.
2. Over-voltage protection (OVP) – Inverter shut-down, manual reset by AC input recycle or by OUT button or by communication port command
3. Over-voltage trip point
   V 0.5-10 0.5-12 1-19 1-24 2-36 2-44 5-66 5-88 5-110 5-165 5-330 5-660
4. Output under voltage limit (UVL) – Preset by front panel or communication port. Prevents from adjusting Vout below limit. Does not affect analog programming.
5. Over temperature protection – User selectable, latched or non latched.

2.8 FRONT PANEL

   – OVP/UVL manual adjust by Vout. Adjust encoder
   – Address selection by Voltage adjust encoder. No of addresses: 31.
   – Go to local control.
   – Output on/off
   – AC on/off
   – Front panel Lock
   – Foldback control
   – Baud rate selection: 1200, 2400, 4800, 9600 and 19200
   – Re-start modes (automatic restart, safe mode)
2. Display – Vout: 4 digits, accuracy: 0.5% of rated output voltage +/-1count.
   – Iout: 4 digits, accuracy: 0.5% of rated output current +/-1count.
3. Indications – VOLTAGE, CURRENT, ALARM, FINE, PREVIEW, FOLDBACK, REMOTE(RS232,RS485,IEEE, LAN,USB), OUTPUT ON, FRONT PANEL LOCK.

2.9 ENVIRONMENTAL CONDITIONS

1. Operating temperature – 0~50 C, 100% load.
2. Storage temperature – 20~85 C
3. Operating humidity % 20~90% RH (no condensation).
4. Storage humidity % 10~95% RH (no condensation).
5. Altitude – Maximum 3000m. Derate output current by 2%/100m above 2000m.

2.10 MECHANICAL

1. Cooling – Forced air cooling by internal fans.
2. Weight Kg Less than 16 Kg
3. Dimensions (W x H x D) mm W: 423 H: 88, D: 442.5 (Refer to Outline drawing).
5. Shock – Less than 20G, half sine, 11m/s. Unit is unpacked.

2.11 SAFETY/EMC

1. Applicable Standards Safety
   – JLB0950-1:2007(Ed.2), IEC 60950-1:2005(Ed.2)+A1, EN 60950-1:2006(Ed.2)+A11 +A1 +A12
   – EN50022, EN50024, EN61000-3-2, FCC part 15, VCCI
   – Conducted emission – EN55022 class A, FCC part 15 class A, VCCI A. Radiated emission – EN55022 class A, FCC part 15 class A, VCCI class A.

2. Interface classification
   – Models with Vout<50V: Output is SELV, all communication/control interfaces (RS232/485, IEEE, isolated Analog, LAN, Sense, Remote Programming and Monitoring) are SELV.
   – Models with 60V<Vout<600V: Output is Hazardous, communication/control interfaces: RS232/485, IEEE, Isolated Analog, LAN, Remote Programming and Monitoring (pins 1-3, pins 14-16) are SELV, Sense, Remote Programming and Monitoring (pins 8-13, pins 21-25) are Hazardous.
   – Models with 400V<Vout<9000V: Output is Hazardous, all communication/control interfaces RS232/485, IEEE, Isolated Analog, LAN, Sense, Remote Programming and Monitoring) are Hazardous.

3. Withstand voltage
   – V<sub>out</sub><sub>><</sub>50V models: Input-Output (SELV): 4242VDC 1min, Input-communication/control (SELV): 4242VDC 1 min, Input-Ground: 2828VDC 1 min.
   – 60V<sub>><</sub>V<sub>out</sub><sub>><</sub>100V models: Input-Output (Hazardous): 2600VDC 1 min, Input-communication/control (SELV): 4242VDC 1 min, Output(Non-Hazardous)-SELV: 1900VDC 1 min, Output(Hazardous)-Ground: 1900VDC 1 min, Input-Ground: 2828VDC 1 min.
   – 100V<V<sub>out</sub><sub>><</sub>600V models: Input-Output(Hazardous): 3550VDC 1 min, Input-communication/control (SELV): 4242VDC 1 min, Hazardous: Output-communication/control(SELV): 4242VDC 1 min, Output(Hazardous)-Ground: 2670VDC 1 min, Input-Ground: 2828VDC 1 min.

4. Insulation resistance – More than 100Mohm at 25°C, 70%RH.
Notes:

*1. Minimum voltage is guaranteed to maximum 0.2% of the rated output voltage.

*2. Minimum current is guaranteed to maximum 0.4% of the rated output current.

*3. For cases where conformance to various safety standards (UL, IEC etc) is required, to be described as 190~240Vac (50/60Hz) for 3-Phase 200V models, and 380~415Vac (50/60Hz) for 3-Phase 400V models and 432~528Vac (50/60Hz) for 3-Phase 480V models.

*4. 3-Phase 200V models: at 200VAC input voltage.
   3-Phase 400V/480V: at 380Vac/432V input voltage. With rated output power.

*5. Not including EMI filter inrush current, less than 0.2mSec.

*6. 3-Phase 200V models: 170-265Vac, constant load.
   3-Phase 400V models: 342-460Vac, constant load.
   3-Phase 480V models: 432-528Vac, constant load.

*7. From No-Load to Full Load, constant input voltage. Measured at the sensing point in Remote Sense.

*8. For 8V-300V models: measured with JEITA RC-9131A (1:1) probe.
   For 600V model: Measure with 10:1 probe.

*9. From 10% to 90% or 90% to 10% of rated output voltage, with rated resistive load.

*10. From 90% to 10% of rated output voltage.

*11. For load voltage change, equal to unit voltage rating, constant input voltage.

*12. For 8V-16V models the ripple is measured at 2V to rated output voltage and rated output current. For other models the ripple is measured at 10~100% of rated output voltage and rated output current.

*13. The Constant Current programming, read back and monitoring accuracy does not include the warm-up and load regulation thermal drift.

2.12 Supplemental Characteristics

The supplemental characteristics give typical but non-warranted performance characteristics. The supplemental characteristics are useful in assessing applications for the power supply. Several kinds of supplemental characteristics are listed below.

1. Evaluation Data: Typical performance of the power supply
2. Reliability Data: Reliability performance of the power supply.
3. EN61000 Data: Performance of the power supply under EN61000 test conditions.
4. EMI Data: Typical EMI (conducted and radiated) performance of the power supply.

The supplemental characteristics data is held in each TDK Lambda Americas Sales and Service facility. For further details please contact the TDK Lambda Americas office nearest you.

Notes:
1. Analog programming connector. Matting plug supplied with power supply.
2. Bus-bars for 8V to 100V models. See detail.
3. Wire clamp connector for 150V to 600V models (shown).
4. AC input connector (supplied with plug-in connector).
5. Header P/N: FC6-16/4-GF-10.16 Phoenix Contact
6. Chassis slides mounting holes #10-32 marked "A". GENERAL DEVICES P/N: C-300-S-116 or equivalent.
7. Bus Bar enclosure for 60V to 600V.
8. Mounting holes for 19" rack. Use M6x16 screws to fix the unit to the rack.
3. Installation

3.1. General

This Chapter contains instructions for initial inspection, preparation for use and repackaging for shipment. Connection to PC, setting the communication port and linking Genesys™ power supplies are described in Chapter 7.

**WARNING**

The Genesys™ series is intended only for installation in Restricted Access Location (RAL). Access to Hazardous parts (rear side of the power supply) shall be prevented after installation.

**NOTE**

Genesys™ power supplies generate magnetic fields, which might affect the operation of other instruments. If your equipment is susceptible to magnetic fields, do not position it adjacent to the power supply.

**WARNING**

To avoid electric shock hazard, do not insert conductive parts through the front panel slits.

3.2. Preparation for Use

In order to be operational the power supply must be connected to an appropriate AC source. The AC source voltage should be within the power supply specification. Do not apply power before reading Section 3.3, 3.6 and 3.7.

Table 3-1 below, describes the basic setup procedure. Follow the instructions in Table 3-1 in the sequence given to prepare the power supply for use.

**Table 3-1: Basic setup procedure**
3.3. **Initial Inspection**

Prior to shipment this power supply was inspected and found free of mechanical or electrical defects. Upon unpacking of the power supply, inspect for any damage, which may have occurred in transit.

The inspection should confirm that there is no exterior damage to the power supply such as broken knobs or connectors and that the front panel and meters face are not scratched or cracked. Keep all packing material until the inspection has been completed. If damage is detected, file a claim with carrier immediately and notify the TDK-Lambda Americas Inc. sales or authorized service facility nearest you.

3.4. **Rack Mounting**

The Genesys™ power supply series is designed to fit in a standard 19" equipment rack.

3.4.1. **To install the Power Supply in a rack:**

a) Use the front panel rack-mount brackets to install the power supply in the rack.

b) Use a support bar to provide adequate support for the rear of the power supply. Do not obstruct the air exhaust at the rear panel of the unit.

3.4.2. **Rack Mount Slides (optional):**

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ensure that the screws used to attach the slides to the unit do not penetrate more than 6mm into the sides of the unit.</td>
</tr>
</tbody>
</table>

Use rack mount slides: General Devices P/N: C-300-S-116 or equivalent to install the unit in a standard 19" equipment rack. Refer to Fig. 3-1 for slides assembly instructions. Use three #10-32x0.38” (max.) screws at each side. To prevent internal damage, use the specified screw length only.

![Fig.3-1: Rack-mount slides assembly](image)

3.4.3. **Plastic Supporting Legs**

Use the four plastic legs supplied with the unit, when the power supply is mounted on a surface or when units are stacked without rack support. When using the plastic legs, maximum three units can be stacked.
3.5. **Location, Mounting and Cooling**

This power supply is fan cooled. The air intake is at the front panel and the exhaust is at the rear panel. Upon installation, allow cooling air to reach the front panel ventilation inlets. Allow a minimum of 10cm (4 Inch) of unrestricted air space at the front and the rear of the unit.

The power supply should be used in an area that the ambient temperature does not exceed +50°C.

3.6. **AC Source Requirements**

The Genesys™ series designed for use in TN, TT and IT power distribution systems. Depending on its input option, the Genesys™ 5000W series can be operated from a nominal 190V to 240V and three phase 200V models, 380-415V, 50/60Hz for three phase 400V models and 432-528V, 50/60Hz for three phase 480V models. The input voltage range and current required for each model is specified in Chapter 2. Ensure that under heavy load, the AC voltage supplied to the power supply does not fall below the specifications described in Chapter 2.

3.7. **AC Input Power Connection**

<table>
<thead>
<tr>
<th><strong>CAUTION</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection of this power supply to an AC power source should be made by an electrician or other qualified personnel</td>
</tr>
</tbody>
</table>

The power supply shall be connected to the AC source via protective device (circuit breaker, fuses, etc.) rated 30A max.

<table>
<thead>
<tr>
<th><strong>WARNING</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>There is a potential shock hazard if the power supply chassis (with cover in place) is not connected to an electrical safety ground via the safety ground in the AC input connector.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>WARNING</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Some components inside the power supply are at AC voltage even when the On/Off switch is in the &quot;Off&quot; position. To avoid electric shock hazard, disconnect the line cord and load and wait two minutes before removing cover.</td>
</tr>
</tbody>
</table>

The power supply ON/OFF switch is not the main disconnect device and does not completely disconnect all the circuits from the AC source.

An appropriately rated disconnect device such as circuit breaker, type B plug on power cord...etc., shall be provided in the final installation. The disconnect device shall comply with UL/IEC 60950-1 requirements and shall be easily accessible.

3.7.1. **AC Input Connector**

The AC input connector is a header (Phoenix Contact P/N:PC6-16/4-GF-10,16) with a screw plug in connector (Phoenix Contact P/N:PC 6/4-STF-10,16), located on the rear panel.

Use suitable wires and tightening torque as follows:

1. Wire diameter: 12AWG for three-phase 200V models and 14AWG for three-phase 400V models.
2. 16AWG for three-phase 480V Refer to Table 1-1 for details.
2. Tightening torque: 10.7-13.4 Lb-inch. (1.2-1.5Nm).

### 3.7.2. AC Input Cord

**WARNING**

The AC input cord is not provided with the power supply.

Refer to Section 1.3.4 for details of the AC input cords and to section 3.7 for disconnected device requirement.

### 3.7.3. AC Input Wire Connection

a. Strip the outside insulation of the AC cable approx. 10cm (3.94 inches). Trim the wires so that the ground wire is 10mm longer than the other wires. Strip 10mm (0.4 inches) at the end of each of the wires.

b. Unscrew the base of the strain relief from the helix-shaped body. Insert the base through the outside opening in the AC input cover and screw the locknut securely 11-14 Lb-inch (1.3 -1.6Nm) into the base, from the inside.

c. Slide the helix-shaped body onto the AC cable. Insert the stripped wires through the strain relief base until the outer cable jacket is flush with the edge of the base. Tighten 16-18 Lb-inch (18 -20Nm) the body to the base while holding the cable in place. Now the cable is securely fastened inside the strain relief. Refer to Fig. 3-2.

![Fig.3-2: Stripped Wires installed in Strain Relief](image)

---

d. Connect the AC wires to the terminals of the input plug supplied with the unit. To connect the wires, loosen the terminal screw, insert the stripped wire into the terminal and tighten the screw securely (10.7-13.4 Lb-inch) (1.21 – 1.5Nm) Refer to Fig. 3-3 for details. Pay attention to connect the wires according to the polarity marking on the plug.

![Fig.3-3: AC Input plug (3-Phase shown)](image)

e. Connect the AC input plug to the AC input connector at the power supply rear panel. Fasten the plug to the connector using the two screws at each side of the plug. (Tightening torque: 4.4-5.3 Lb-inch (0.5 – 0.6Nm)
f. Route the wires inside the cover to prevent pinching. Fasten the cover to the unit using the M3x8 Flat Head screws are provided. Refer to Fig.3-4 for details. Tighten screws securely (4.8 - 4.9LB-inch, 0.54-0.55 Nm)

Fig.3-4: AC input cover and strain relief

3.8. Turn-On Checkout Procedure

3.8.1. General

The following procedure ensures that the power supply is operational and may be used as a basic incoming inspection check. Refer to Fig. 4-1 and fig. 4-2 for the location of the controls indicated in the procedure.

3.8.2. Prior to Operation

a) Ensure that the power supply is configured to the default setting:
   - AC On/Off switch at Off position.
   - Dip switch: All positions at Down ("Off") position.
   - J2 Sense connector: Configured to Local Sense as shown in Fig. 3-5:

   1  Remote (+) sense
   2  Local (+) sense
   3  Not connected
   4  Local (-) sense
   5  Remote (-) sense

   Fig.3-5: Sense Connector Default Connection
   - For units equipped with IEEE option, ensure that the IEEE_En switch is in Up (default) position (Refer to Fig.4-2, item 9 for location), if checkout is to be done in IEEE mode.

b) Connect the unit to an AC source as described in Section 3.7.

c) Connect a DVM with appropriate cables for the rated voltage to the output terminals.

d) Turn the front panel AC power switch to On.

3.8.3. Constant Voltage Check

a) Turn on the output by pressing the OUT pushbutton so the OUT LED illuminates.

b) Observe the power supply VOLT display and rotate the Voltage encoder. Ensure that the Output Voltage varies while the VOLT encoder is rotated. The minimum control range is from zero to the maximum rated output for the power supply model.
c) Compare the DVM reading with the front panel VOLT display to verify the accuracy of the VOLT display. Ensure that the front panel VOLT LED is On.
d) Turn Off the front panel AC power switch.

3.8.4. Constant Current Check

a) Ensure that the front panel AC power switch is at the Off position and the DVM connected to the output terminals shows zero voltage.
b) Connect a DC shunt across the output terminals. Ensure that the shunt and the wire current ratings are higher than the power supply rating. Connect a DVM to the shunt.
c) Turn the front panel AC power switch to the On position,
d) Turn On the output by pressing OUT pushbutton so the OUT LED illuminates.
e) Observe the power supply CURRENT display and rotate the CURRENT encoder. Ensure that the Output Current varies while the CURRENT encoder is rotated. The minimum control range is from zero to the maximum rated output for the power supply model.
f) Compare the DVM reading with the front panel CURRENT display to verify the accuracy of the CURRENT display. Ensure that the front panel CURRENT LED is On.
g) Turn Off the front panel AC power switch.
h) Remove the shunt from the power supply output terminals.

3.8.5. OVP Check

Refer to Section 5.3 for explanation of the OVP function prior to performing the procedure below.

a) Turn the front panel AC power switch to the On position and turn on the output by pressing OUT pushbutton.
b) Using the VOLT encoder, adjust the Output Voltage to approx. 10% of the unit voltage rating.
c) Momentarily press the OVP/UVL button so that the CURRENT display shows “OUP”. The VOLTAGE display will show the last setting of the OVP level.
d) Rotate the VOLT encoder CCW to adjust the OVP setting to 50% of the unit voltage rating.
e) Wait a few seconds until the VOLT display returns to show the Output Voltage.
f) Adjust the Output Voltage toward its maximum and check that the Output Voltage cannot be increased more than the OVP setting.
g) Adjust OVP limit to the maximum by repeating Step 3 and rotating the VOLT encoder CW.

3.8.6. UVL Check

Refer to Section 5.4 for explanation of the UVL function prior to performing the procedure below.

a) Press the OVP/UVL button TWICE so that the CURRENT display shows “UUL”. The VOLTAGE display will show the last setting of the UVL level.
b) Rotate the VOLT encoder to adjust the UVL level to approx. 10% of the unit voltage rating.
c) Wait a few seconds until the VOLT display returns to show the output voltage.
d) Adjust the output voltage toward its minimum and check that the output voltage cannot be decreased below the UVL setting.
e) Adjust the UVL limit to the minimum by repeating Step 1 and rotating the VOLT encoder CCW.
3.8.7. Foldback Check

**WARNING**
Shorting the output may expose the user to hazardous voltages.
Observe proper safety procedures.

Refer to Section 5.5 for explanation of the FOLD function prior to performing the procedure below.

a) Ensure that the Output Voltage is set to approx. 10% of the unit rating.
b) Adjust the CURRENT encoder to set the Output Current setting to approx. 10% of the unit rating.
c) Momentarily press the FOLD button. Ensure that the FOLD LED illuminates. The Output Voltage remains unchanged.
d) Short the output terminals momentarily (approx. 0.5 sec.). Ensure that the Output Voltage falls to zero, the VOLT display shows “Fb” and the ALARM LED blinks.
e) Press the FOLD button again to cancel the protection. The Output Voltage remains zero.
f) Press the OUT button. Ensure that the Output Voltage returns to its last setting.
g) Turn the output off by pressing the OUT button. Ensure that the VOLT display shows “OFF”.

3.8.8. Address Setting

a) Press and hold the REM/LOC button for approx. 3 sec. The VOLT display will show the communication port address.
b) Using the VOLT adjust encoder, check that the address can be set within the range of 0 to 30.

3.8.9. Baud Rate Setting (RS-232 and RS-485 only)
a) Press and hold the REM/LOC button for approx. 3 sec. The CURRENT display will show the communication port Baud Rate.
b) Using the CURRENT adjust encoder, check that the Baud Rate can be set to 1200, 2400, 4800, 9600 and 19200.

3.9. Connecting the Load

**WARNING**
Turn Off the AC input power before making or changing any rear panel connection. Ensure that all connections are securely tightened before applying power. There is a potential shock hazard when using a power supply with a rated output greater than 40V.

3.9.1. Load Wiring
The following considerations should be made to select wiring for connecting the load to the power supply:

- Current carrying capacity of the wire (refer to Section 3.9.2)
- Insulation rating of the wire should be at least equivalent to the maximum output voltage of the power supply.
- Maximum wire length and voltage drop (refer to Section 3.9.2)
- Noise and impedance effects of the load wiring (refer to Section 3.9.4).
3.9.2. Current Carrying Capacity

Two factors must be considered when selecting the wire size:

a) Wires should be at least heavy enough not to overheat while carrying the power supply load current at the rated load, or the current that would flow in the event the load wires were shorted, whichever is greater.

b) Wire size should be selected to enable voltage drop per lead to be less than 1.0V at the rated current. Although units will compensate for up to 5V in each load wire, it is recommended to minimize the voltage drop (1V typical maximum) to prevent excessive output power consumption from the power supply and poor dynamic response to load changes. Please refer to Tables 3-2 and 3-3 for maximum wire length (to limit voltage drop) in American and European dimensions respectively.

</table>

Table 3-3: Maximum wire length for 1 V drop on lead (in meters)

For currents not shown in Table 3-2 and 3-3, use the formula:
Maximum length=1000/(current x resistivity)
Where current is expressed in Amperes and resistivity in ohms/km or ohms/1000 ft.

3.9.3. Wire Termination

The wires should be properly terminated with terminals securely attached. DO NOT use unterminated wires for load connection at the power supply.

CAUTION

When local sensing, a short from +LS or +S to -V or -S or -LS, will cause damage to the power supply. Reversing the sense wires might cause damage to the power supply in local and remote sensing. (Do not connect -S to +V or +S to -V).
3.9.4. Noise and Impedance Effects

To minimize the noise pickup or radiation, the load wires and remote sense wires should be twisted pairs to the shortest possible length. Shielding of sense leads may be necessary in high noise environments. Where shielding is used, connect the shield to the chassis via a rear panel Ground screw. Even if noise is not a concern, the load and remote sense wires should be twisted-pairs to reduce coupling, which might impact the stability of power supply. The sense leads should be separated from the power leads.

Twisting the load wires reduces the parasitic inductance of the cable, which could produce high frequency voltage spikes at the load and the output of the power supply, because of current variation in the load itself.

The impedance introduced between the power supply output and the load could make the ripple and noise at the load worse than the noise at the power supply rear panel output. Additional filtering with bypass capacitors at the load terminals may be required to bypass the high frequency load current.

3.9.5. Inductive Loads

Inductive loads can produce voltage spikes that may be harmful to the power supply. A diode should be connected across the output. The diode voltage and current rating should be greater than the power supply maximum output voltage and current rating. Connect the cathode to the positive output and the anode to the negative output of the power supply.

Where positive load transients such as back EMF from a motor may occur, connect a surge suppressor across the output to protect the power supply. The breakdown voltage rating of the suppressor must be approximately 10% higher than the maximum output voltage of the power supply.

3.9.6. Making the Load Connections

**WARNING**

Hazardous voltages may exist at the outputs and the load connections when using a power supply with a rated output greater than 40V. To protect personnel against accidental contact with hazardous voltages, ensure that the load and its connections have no accessible live parts. Ensure that the load wiring insulation rating is greater than or equal to the maximum output voltage of the power supply.

**CAUTION**

Ensure that the load wiring mounting hardware does not short the output terminals. Heavy connecting cables must have some form of strain relief to prevent loosening the connections or bending the bus-bars.

**8V to 100V Models**

Refer to Fig.3-6 for connection of the load wires to the power supply bus-bars and to Fig.3-7 for mounting the bus-bars shield to the chassis.
4183515000 Rev E

Fig. 3-6: Load Wires Connection, 8V to 100V Models

Fig. 3-7: Bus-bars shield mounting, 8V to 40V models

Fig. 3-8: Bus-bars shield mounting, 60V to 100V models

**150V to 600V Models**

**WARNING**

Hazardous voltages exist at the outputs and the load connections. To protect personnel against accidental contact with hazardous voltages, ensure that the load and its connections have no accessible live parts. Ensure that the load wiring insulation rating is greater than or equal to the maximum output voltage of the power supply.

**CAUTION**

**Output Load Wires No Conductor Pretreatment:** Phoenix Contact clamping parts are designed so that all kinds of copper conductors can be clamped with pretreatment. It is forbidden to solder the conductors. The solder tin yields and fractures under high pressure. The result is increased contact resistance and an excessive temperature rise. In addition, corrosion caused by pickling or fluxes has been observed on soldered conductor ends. Notch fractures at the transition point from the rigid to the flexible conductor area are also possible.
The 150V to 600V models have a four terminal wire clamp output connector.
Phoenix Contact P/N: FRONT4-H-7.62/4
The two left terminals are the positive outputs and the two right terminals are the negative outputs. Max. 30A per terminal.
The connector requirements are as follows:
a) Wires: AWG18 to AWG10.
b) Tightening torque: 4.4-5.3 Lb-inch. (0.5-0.6Nm).

Follow the instructions below for connection of the load wires to the power supply:
a) Strip approx. 10mm at the end of each of the load wires.
b) Loosen the connector terminal screws.
c) Loosen screws “B” from enclosure bottom cover to release the shutter.
d) Insert the stripped wires into enclosure bottom cover opening and then to the terminals, tighten the terminals screws securely (see fig. 3-9)
e) Assemble the enclosure top cover to the chassis as shown in Fig. 3-9, using clamp “A1” and screw “A2”, tighten screw “A2” (tightening torque: 4.8-5.3 Lb-inch).

f) Assemble the enclosure bottom cover to its place, as shown in Fig. 3-10, using screws “C”, 3 places (tightening torque 4.8-5.3 Lb-inch).
g) Slide down the shutter to secure load wires in place, and tighten screws “B”.

---

Fig. 3-9: Load Wires connection to the output connector

Fig. 3-10: Enclosure assembly
3.9.7. Connecting single loads, local sensing (default).

Fig.3-11 shows recommended load and sensing connections for a single load. The local sense lines shown are default connections at the rear panel J2 sense connector. Local sensing is suitable for applications where load regulation is less critical.

![Fig.3-11: Single load connection, local sensing](image)

Fig.3-12 shows recommended remote sensing connection for single loads. Remote sensing is used when, in Constant Voltage mode, the load regulation is important at the load terminals. Use twisted or shielded wires to minimize noise pick-up. If shielded wires are used, the shield should be connected to the ground at one point, either at the power supply chassis or the load ground. The optimal point for the shield ground should be determined by experimentation.

![Fig.3-12: Remote sensing, single load](image)

3.9.9. Connecting Multiple Loads, Radial Distribution Method

Fig.3-13 shows multiple loads connected to one supply. Each load should be connected to the power supply’s output terminals using separate pairs of wires. It is recommended that each pair of wires will be as short as possible and twisted or shielded to minimize noise pick-up and radiation. The sense wires should be connected to the power supply output terminals or to the load with the most critical load regulation requirement.
3.9.10. Multiple Load Connection with Distribution Terminals

If remotely located output distribution terminals are used, the power supply output terminals should be connected to the distribution terminals by pair of twisted and/or shielded wires. Each load should be separately connected to the remote distribution terminals (see Fig.3-14).

If remote sensing is required, the sensing wires should be connected to the distribution terminals or at the most critical load.

3.9.11. Grounding Outputs

Either the positive or negative output terminals can be grounded. To avoid noise problems caused by common-mode current flowing from the load to ground, it is recommended to ground the output terminal as close as possible to the power supply chassis ground.

Always use two wires to connect the load to the power supply regardless of how the system is grounded.

**WARNING**

Models up to 60VDC Rated Output shall not float outputs more than +/-60VDC above/below chassis ground. Models > 60VDC Rated Output shall not float outputs more than +/-600VDC above/below chassis ground.
3.10. Local and Remote Sensing

The rear panel J2 sense connector is used to configure the power supply for local or remote sensing of the Output Voltage. Refer to Fig.3-15 for sense connector location 3.10.1.

3.10.1. Sense Wiring

</tr>
<tr>
<td>J2-5</td>
<td>Remote negative sense (-S).</td>
</tr>
</tbody>
</table>

Table 3-4: J2 terminals
3.10.3. Remote Sensing

**WARNING**
There is a potential shock hazard at the sense point when using a power supply with a rated Output Voltage greater than 40V. Ensure that the connections at the load end are shielded to prevent accidental contact with hazardous voltages.

**CAUTION**
When using shielded sense wires, ground the shield in one place only. The location can be the power supply chassis or one of the output terminals.

Use remote sense where the load regulation at the load end is critical. In remote sense, the power supply will compensate for voltage drop on the load wires. Refer to the power supply specifications for the maximum voltage drop on load wires. The voltage drop is subtracted from the total voltage available at the output. Follow the instructions below to configure the power supply for remote sensing:

a) Ensure that the AC On/Off is in the Off position.
b) Remove the local sense jumpers from J2.
c) Connect the negative sense lead to terminal J2-5 (-S) and the positive sense lead to terminal J2-1(+S) of the J2 mating connector. Ensure that the J2 mating connector is plugged securely into the rear panel sense connector.
d) Turn On the power supply.

**Notes:**
1. If the power supply is operating in remote sense and either the positive or negative load wire is not connected, an internal protection circuit will activate and shut down the power supply. To resume operation, turn the AC On/Off to the Off position, connect the open load wire, and turn On the power supply.
2. If the power supply is operated without the remote sense lines or local sense jumpers, it will continue to work, but the output voltage regulation will be degraded. Also, the OVP circuit may activate and shut down the power supply.

3.10.4. J2 Sense Connector Technical Information
- J2 connector type: MC 1.5/5-G-3.81, Phoenix.
- Plug type: MC 1.5/5-ST-3.81, Phoenix.
- Wire AWG; 28 up to 16.
- Stripping length: 7mm.
- Tightening torque: 1.95-2.21Lb-Inch. (0.22-0.25Nm)

3.11. Repackaging for Shipment
To ensure safe transportation of the instrument, contact the TDK-Lambda Americas Inc. sales or service facility near you for Return Authorization and shipping information. Please attach a tag to the power supply describing the problem and specifying the owner, model number and serial number of the power supply. Refer to Warranty Information for further instructions.
4. Front and Rear Panel Controls and Connectors

4.1. Introduction

The Genesys™ Power Supply series has a full set of controls, indicators and connectors that allow the user to easily setup and operate the unit. Before starting to operate the unit, please read the following Sections for explanation of the functions of the controls and connectors terminals.

- Section 4.2: Front Panel Controls and Indicators.
- Section 4.3: Rear Panel Connections and Controls.

4.2. Front Panel Controls and Indicators

See Fig.4-1 to review the controls, indicators and meters located on the power supply front panel.

4.4. Rear Panel SW1 Setup Switch

The SW1 Setup switch (see Fig.4-3) is a 9-position DIP-switch that allows the user to choose the following:
- Internal or remote programming for Output Voltage and Output Current.
- Remote voltage or resistive programming of Output Voltage and Output Current.
- Select range of remote voltage and resistive programming.
- Select range of output Voltage and Output Current monitoring.
- Select the Remote Shut-Off control logic.
- Select between RS232 and RS485 communication interface.
- Enable or disable the rear panel Enable/Disable control (dry contact).

![Fig.4-3: SW1 setup DIP-switch](image)
4.4.1. SW1 Position Function

Refer to Table 4-3 for description of SW1 position functions. The factory default setting is Down for all positions.

4.4.2. Resetting the SW1 Switch

Before making any changes to the SW1 switch setting, disable the power supply output by pressing the front panel OUT button. Ensure that the Output Voltage falls to zero and the OUT LED is off. Then use any small flat-bladed screwdriver to change the SW1 switch setting.
4.5. **Rear Panel J1 Programming and Monitoring Connector**

The J1 Programming and Monitoring connector is a DB25 subminiature connector located on the power supply rear panel. Refer to Table 4-4 for description of the connector functions. The power supply default configuration is Local operation, which does not require connections to J1. For remote operation using J1 signals, use the plug provided with power supply (or equivalent type). It is essential to use a plastic body plug to conform to Safety Agency requirements. If a shield is required for the J1 wires, connect the shield to a power supply chassis ground screw.

4.5.1. **Making J1 Connections**

- J1 Connector type: AMP, P/N:5747461-3
- J1 plug description: AMP, P/N:749809-9 or equivalent.
- Wire dimension range: AWG26-22
- Extraction tool: AMP, 91232-1 or equivalent.
- Manual Pistol grip tool:
  - Handle:AMP, P/N:58074-1
  - Head:AMP, P/N:58063-2

Before making any connection, turn the AC On/Off switch to the Off position and wait until the front panel display has turned Off.

**CAUTION**

The programming return terminals (12, 22 and 23) are referenced internally to the -V potential of the power supply. Do not attempt to bias any of these terminals relative to the negative sense. Use the Isolated Programming interface option to allow control from a programming source at a different potential relative to the power supply negative output.

**CAUTION**

To prevent ground loops and to maintain power supply isolation when programming from J1, use an ungrounded programming source.

**WARNING**

There is a potential shock hazard at the output when using a power supply with rated output greater than 40V. Use wires with minimum insulation rating equivalent to the maximum output voltage of the power supply.

5. LOCAL OPERATION

5.1. Introduction

This Chapter describes the operating modes that are not involved in programming and monitoring the power supply via its serial communication port (RS232/RS485) or by remote analog signals. Ensure that the REM/LOC LED on the front panel is Off, indicating Local mode. If the REM/LOC LED is On, press the front panel REM/LOC button to change the operating mode to Local.

— For information regarding Remote Analog Programming, refer to Chapter 6.
— For information regarding the Serial Communication Port, refer to Chapter 7.

5.2. Standard Operation

The power supply has two basic operating modes: Constant Voltage Mode and Constant Current Mode. The mode in which the power supply operates at any given time depends on the Output Voltage setting, Output Current setting and the load resistance.

5.2.1. Constant Voltage Mode

a) In constant voltage mode, the power supply regulates the Output Voltage at the selected value, while the load current varies as required by the load.
b) While the power supply operates in constant voltage mode, the VOLTAGE LED on the front panel illuminates.
c) Adjustment of the Output Voltage can be made when the power supply output is enabled (Output On) or disabled (Output Off). When the output is enabled, simply rotate the VOLTAGE encoder knob to program the output voltage. When the output is disabled, press the PREV button and then rotate the VOLTAGE encoder knob. The VOLTAGE meter will show the programmed Output Voltage for 5 seconds after the adjustment has been completed. Then the VOLTAGE meter will display “OFF”.
d) Adjustment resolution can be set to coarse or fine resolution. Press FINE button to select between the lower and higher resolution. The FINE LED turns On when the resolution is set to FINE.

NOTE

If after completing the adjustment, the display shows a different value than the setting, the power supply may be at current limit. Check the load condition and the power supply Output Current setting.

NOTE

The maximum and minimum setting values of the output voltage are limited by the Over Voltage protection and Under Voltage limit setting. Refer to Sections 5.3 and 5.4 for more details.
5.2.2. **Constant Current Mode**

a) In constant current mode, the power supply regulates the Output Current at the selected value, while the voltage varies with the load requirement.

b) While the power supply is operating in constant current mode, the CURRENT LED on the front panel illuminates.

c) Adjustment of the Output Current setting can be made when the power supply output is enabled (Output On) or disabled (Output Off).

   - Disabled output (Off): Press PREV button and then rotate the Current encoder knob. The CURRENT meter will show the programmed Output Current limit for 5 seconds after the adjustment has been completed. Then the VOLTAGE meter will display “OFF”.
   
   - Enabled output, power supply in Constant Voltage mode: Press the PREV button and then rotate the CURRENT encoder knob. The CURRENT meter will show the programmed Output Current for 5 seconds after the adjustment has been completed, and then will return to show the actual load current.
   
   - Enabled output, power supply in Constant Current mode: Rotate the CURRENT encoder knob to adjust the Output Current.

d) Adjustment resolution can be set to Coarse or Fine adjustment. Press the FINE button to select between the Coarse and Fine resolution. The FINE LED turns On when the resolution is set to FINE.

5.2.3. **Automatic Crossover**

If the power supply operates in Constant Voltage mode, while the load current is increased to greater than the current limit setting, the power supply will automatically switch to Constant Current mode. If the load is decreased to less than the current limit setting, the power supply will automatically switch back to Constant Voltage mode.

5.3. **Over Voltage Protection (OVP)**

The OVP circuit protects the load in the event of a remote or local programming error or a power supply failure. The protection circuit monitors the voltage at the power supply sense points and thus provides the protection level at the load. Upon detection of an Over Voltage condition, the power supply output will shut down.

5.3.1. **Setting the OVP Level**

The OVP can be set when the power supply output is Enabled (On) or Disabled (Off). To set the OVP level, press the OVP/UVL button, so that the CURRENT meter shows “OUP”. The VOLTAGE meter shows the OVP setting level. Rotate the VOLTAGE encoder knob to adjust the OVP level. The display will show “OUP” and the setting value for 5 seconds after the adjustment has been completed, and then will return to its previous state.

The minimum setting level is approximately 105% of the set Output Voltage, or the value in Table 7-6, whichever is higher. The maximum setting level is shown in Table 5-1.

*Table 5-1: Maximum OVP setting levels*
To preview the OVP setting, press the OVP/UVL pushbutton so that the CURRENT display will show “OUP”. At this time, the VOLTAGE display will show the OVP setting. After 5 seconds, the display will return to its previous state.

5.3.2. Activated OVP Protection Indications

When the OVP is activated the power supply output shuts down. The VOLTAGE display shows “OUP” and the ALARM LED blinks.

5.3.3. Resetting the OVP Circuit

To reset the OVP circuit after it activates:

a) Reduce the power supply Output Voltage setting below the OVP set level.

b) Ensure that the load and the sense wiring are connected properly.

c) There are four methods to reset the OVP circuit.
   • Press the OUT button.
   • Turn the power supply Off using the AC On/Off switch, wait until the front panel display turns Off, then turn the power supply On using the AC On/Off switch.
   • Turn the power supply output Off and then On using the SO control (refer to Section 5.7). In this method the power supply should be set to Auto-Restart mode.
   • Send an OUT 1 command via the RS232/RS485 communication port.

5.4. A Under Voltage Limit (UVL)

The UVL prevents adjustment of the Output Voltage below a certain limit. The combination of UVL and OVP functions, allow the user to create a protection window for sensitive load circuitry.

5.4.1. Setting the UVL Level

Setting the UVL can be made when the power supply output is Enabled (On) or Disabled (Off). To set the UVL level, press the OVP/UVL button TWICE, so that the CURRENT meter shows “UUL”. The VOLTAGE meter shows the UVL setting level. Rotate the VOLTAGE encoder knob to adjust the UVL level. The display will show “UUL” and the setting value for 5 seconds after the adjustment has been completed and then will return to its previous state.

UVL setting values are limited at the maximum level to approximately 95% of the Output Voltage setting. Attempting to adjust the UVL above this limit will result in no response to the adjustment attempt. The minimum UVL setting is zero.

5.5. Foldback Protection

Foldback protection will shut down the power supply output if the load current exceeds the current limit setting level. This protection is useful when the load circuitry is sensitive to an overcurrent condition.

5.5.1. Setting the Foldback Protection

To arm the Foldback protection, the FOLD button should be pressed so that the FOLD LED illuminates. In this condition, transition from Constant Voltage to Constant Current mode will activate the Foldback protection. Activation of the Foldback protection disables the power supply output, causes the ALARM LED to blink and displays “Fb” on the VOLTAGE meter.
5.5.2. Resetting Activated Foldback Protection

There are four methods to reset an activated Foldback protection.

a) Press the OUT button. The power supply output is enabled and the Output Voltage and Current will return to their last setting. In this method, the Foldback protection remains armed, therefore if the load current is higher than the current limit setting, the Foldback protection will be activated again.

b) Press the FOLD button to cancel the Foldback protection. The power supply output will be disabled and the VOLTAGE display will show “OFF”. Press the OUT button to enable the power supply output.

c) Turn the power supply output Off and then On using the SO control (refer to Section 5.7). In this method the Foldback protection remains armed, therefore if the load current is higher than the output current setting, the Foldback protection will be activated.

d) Turn the power supply Off using the AC On/Off switch, wait until the front panel display turns Off, then turn the unit back ON again. The power supply output is enabled and the Output Voltage and Current will return to their last setting. In this method, the Foldback protection remains armed, therefore if the load current is higher than the output current setting, the Foldback protection will be activated again.

5.6. Output On/Off Control

The Output On/Off Enables or Disables the power supply output. Use this function to make adjustments to either the power supply or the load without shutting off the AC power. The Output On/Off can be activated from the front panel using the OUT button or from the rear panel J1 connector. The OUT button can be pressed at any time to Enable or Disable the power supply output. When the output is disabled, the Output Voltage and Current fall to zero and the VOLTAGE display shows “OFF”.

5.7. Output Shut-Off (SO) Control via Rear Panel J1 Connector

Contacts 2, 3 and 15 of J1 (Fig.4-2, Item 5) serve as Output Shut-Off (SO) terminals. The SO terminals accept a 2.5V to 15V signal or Open-Short contact to disable or enable the power supply output. The SO function will be activated only when a transition from On to Off is detected after applying AC power to the unit. (Thus, in Auto-Restart mode, the output will be Enabled after applying AC power; even if SO is at an Off level). After an On to Off transition it is detected, the SO will Enable or Disable the power supply output according to the signal level or the short/open applied to J1. This function is useful for connecting power supplies in a “Daisy-chain” (refer to Section 5.16). The SO control can also be used to reset the OVP and Fold Protection (refer to Section 5.3 and 5.5 for details).

When the unit is shut-off by a J1 signal, the VOLTAGE display will show “SO” to indicate the unit state. J1 contact 15 is the SO signal input and contacts 2 and 3, IF_COM, are the signal return (connected internally). Contacts 2, 3 and 15 are optically isolated from the power supply output.

The SO control logic can be selected by the rear panel SW1 Setup switch. Refer to Table 5-2 for SW1 setting and SO Control Logic.

<table>

<td>Off</td>
</tr>
</tbody>
</table>

**Table 5-3: Enable/Disable function and SW1 setting**

**CAUTION**

To prevent possible damage to the unit, do not connect any of the Enable/Disable inputs to the positive or negative output potential.

**NOTE**

**Safe Start mode**-If the Enable/Disable fault condition clears when units in safe start mode recovery is by pressing OUT button or by sending an ‘OUT 1’ serial command.

**Auto Restart mode**-The output will return back ON automatically when the Enable/Disable fault conditions clears.

5.9. **CV/CC Signal**

CV/CC signal indicates the operating mode of the power supply, Constant Voltage or Constant Current. The CV/CC signal is an open collector output with a 30V parallel zener, at J1-13, referenced to the COM potential at J1-12 (connected internally to the negative sense potential). When the power supply operates in Constant Voltage mode, CV/CC output is open. When the power supply operates in Constant Current mode, the CV/CC signal output is low (0-0.6), with maximum 10mA sink current.

**CAUTION**

Do not connect the CV/CC signal to a voltage source higher than 30VDC. Always connect the CV/CC signal to voltage source with a series resistor to limit the sink current to less than 10mA.

5.10. **PS_OK Signal**

The PS_OK signal indicates the fault condition of the power supply. PS_OK is a TTL signal output at J1-16, referenced to IF_COM at J1-2, 3 (Isolated Interface Common). When a fault condition occurs, the PS_OK level is low, with a maximum sink current of 1mA; when no fault condition occurs, the PS_OK level is high with a maximum source current of 2mA. The following faults will set the PS_OK to a Fault state:

* OTP *Enable/Disable open (Power supply is disabled)
* OVP *SO (Rear panel Shut-Off, Power Supply is shut off)
* Foldback *IEEE failure (With optional IEEE interface)
* AC fail *Output Off
5.11. **Safe-Start and Auto-Restart Modes**

When turning On the power supply AC On/Off, it can start to its last setting of Output Voltage and Current with the output Enabled (Auto-restart mode) or start with the output Disabled (Safe-start mode). Press and hold the OUT button to select between Safe-start and Auto-restart modes. The VOLTAGE display will continuously cycle between “SAF” and “AU7” every 3 seconds. Releasing the OUT pushbutton while one of the modes is displayed, selects that mode. The default setting at shipment is Safe-start mode.

5.11.1. **Auto-Restart Mode**

In this mode, the power supply restores its last operation setting. Upon start-up, the output is enabled or disabled according to its last setting.

5.11.2. **Safe-Start Mode**

In this mode, the power supply restores its last operation setting and sets the Output to an Off state. At start-up, the output is Disabled and the Output Voltage and Current are zero. To Enable the output and restore the last Output Voltage and Current values, momentarily press the OUT button.

5.12. **Over Temperature Protection (OTP)**

The OTP circuit shuts down the power supply before the internal components can exceed their safe internal operating temperature. When an OTP shutdown occurs, the display shows “OTP” (O7P) and the ALARM LED blinks.

Resetting the OTP circuit can be automatic (non-latched) or manual (latched) depending on the Safe-start or Auto-restart mode.

1) **Safe-start mode:** In Safe-start mode, the power supply stays Off after the over temperature condition has been removed. The display continues to show “OTP” (O7P) and the ALARM LED continues to blink. To reset the OTP circuit, press the OUT button (or send an OUT ON command via the serial port).

2) **Auto-restart mode:** In Auto-restart mode, the power supply recovers to its last setting automatically when the over temperature condition is removed.

5.13. **Last Setting Memory**

The power supply is equipped with Last Setting Memory, which stores several power supply parameters at each AC turn-off sequence.

**STORED PARAMETERS:**

1. OUT On or Off
2. Output Voltage setting (PV setting)
3. Output Current setting (PC setting)
4. OVP Level
5. UVL Level
6. FOLD Setting
7. Start-up mode (Safe-start or Auto-restart)
8. Remote/Local: If the last setting was Local Lockout, (latched mode), the supply will return to Remote mode (non-latched).
9. Address setting
10. Baud rate
11. Locked/Unlocked Front Panel (LFP/UFP)
12. Master/Slave setting

(Items 8, 9, 10 are related to Remote Digital Control operation and are explained in Chapter 7)
5.14. Series Operation

Power supplies of the SAME MODEL can be connected in series to obtain increased output voltage. Split connection of the power supplies gives positive and negative output voltage.

**CAUTION**

Do not connect power supplies from different manufacturers in series or in parallel.

5.14.1. Series connection for increased output voltage

In this mode, two units are connected so that their outputs are summed. Set the Current of each power supply to the maximum that the load can handle without damage. It is recommended that diodes be connected in parallel with each unit output to prevent reverse voltage during start up sequence or in case one unit shuts down. Each diode should be rated to at least the power supply rated Output Voltage and Output Current. Refer to Fig.5-1 and 5-2 for series operation with local and remote sensing.

**WARNING**

When power supplies are connected in series, and the load or one of the output terminals is grounded, no point may be at a greater potential of +/-60VDC from ground for models up to 60VDC Rated Output and +/-600VDC from ground for models >60VDC Rated Output. When using RS232/485/LAN or IEEE, refer to the OUTPUT TERMINALS GROUNDING warning in Section 3.9.11.

Fig.5-1: Series connection, local sensing  Fig.5-2: Series connection, remote sensing

(*) Diodes are user supplied.
Remote programming in series operation for increased output voltage:

1. Programming by external voltage: The analog programming circuits of this power supply are referenced to the negative output potential. Therefore, the circuits used to control each series connected unit must be separated and floated from each other.

2. Using the SO function and PS_OK signal: The Shut-Off and PS_OK circuits are referenced to the isolated interface common, IF_COM (J1-2,3). The IF_COM terminals of different units can be connected to obtain a single control circuit for the power supplies connected in series.

3. Programming by external resistor: Programming by external resistor is possible. Refer to Section 6.5 for details.

4. Programming via the Serial Communication port (RS232/485): The communication port is referenced to the IF_COM which is isolated from the power supply output potential. Therefore power supplies connected in series can be daisy-chained using the Remote-In and Remote-Out connectors. Refer to Chapter 7 for details.

5.4.2. Series Connection for Positive and Negative Output Voltage

In this mode, two units are configured as a positive and negative output. Set the Output Current limit of each power supply to the maximum that the load can handle without damage. It is recommended that diodes be connected in parallel with each unit output to prevent reverse voltage during start-up or in case one of the units shuts down. Each diode should be rated to at least the power supply rated output voltage and output current. Refer to Fig.5-3 for this operating mode.

Fig.5-3: Series connection for positive/negative output voltages

(*) Diodes are user supplied.
Remote programming in series operation for positive and negative output voltage

1. Programming by external voltage: The analog programming circuits of this power supply are referenced to the negative output potential. Therefore, the circuits used to control each series connected unit must be separated and floated from each other.

2. Using the SO function and PS_OK signal: The Shut-Off and PS_OK circuits are referenced to the isolated interface common, IF_COM (J1-2,3). The IF_COM terminals of the units can be connected to obtain a single control circuit for the power supplies connected in series.

3. Programming by external resistor: Programming by external resistor is possible. Refer to section 6.5 for details.

4. Programming via the Serial Communication port (RS232/485): The communication port is referenced to the IF_COM which is isolated from the power supply output potential. Therefore power supplies connected in series can be chained using the Remote-In and Remote-Out connectors. Refer to chapter 7 for details.

5.15. Parallel Operation

Up to four units of the same VOLTAGE and CURRENT rating can be connected in parallel to provide up to four times the Output Current capability. One of the units operates as a Master and the remaining units are Slaves. The Slave units are analog programmed by the Master unit. In remote digital operation, only the Master unit can be programmed by the computer, while the Slave units may be connected to the computer for voltage, current and status readback only. Follow the following procedure to configure multiple supplies for parallel operation. With both methods, power supplies should be connected in a Daisy-Chain configuration. Refer to Sec. 5.15.1 and to Sec. 5.15.2 for detailed explanation.

5.15.1. Basic Parallel Operation

In this method, setting the units as Master and Slaves is made by the rear panel J1 connections and the setup switch SW1. Each unit displays its own output current and voltage. To program the load current, the Master unit should be programmed to the total load current divided by the number of units in the system. Refer to the following procedure to configure multiple supplies for basic parallel operation.

5.15.1.1. Setting up the Master Unit

Set the Master unit Output Voltage to the desired voltage. Program the Output Current to the desired load current divided by the number of parallel units. During operation, the Master unit operates in CV mode, regulating the load voltage at the programmed Output Voltage. Connect the sensing circuit to local or remote sensing as shown in Fig.5-4 or Fig.5-5.

5.15.1.2. Setting up the Slave Units

a) The Output Voltage of the Slave units should be programmed 2-5% higher than the Output Voltage of the Master unit to prevent interference with the Master unit’s control. The Output Current setting of each unit should be programmed to the desired load current divided by the number of parallel units.

b) Set the rear panel setup switch SW1 position 2 to the up position.
c) Connect a wire jumper between J1-8 and J1-12 (refer to Table 4-4).

d) Connect J1 terminal 10 (IPGM) of the slave unit to J1 terminal 25 (P) of the master unit.

e) Connect J1 terminal 23 (IPGM_RTN) of the slave unit to J1 terminal 12 (COM) of the master unit.

During operation, the Slave units operate as a controlled current source following the Master Output Current. It is recommended that the power system be designed so that each unit supplies up to 95% of its current rating because of the imbalance which may be caused by cabling and connection voltage drop.

5.15.1.3. Daisy Chain Connection: (See Fig. 5-6)

These set up and connections are optional but are strongly recommended. It will shut down all power supplies when a fault condition occurs in any one of them.

a) Switch SW1 position 5 should be in its down position for all power supplies.

b) Connect J1-16 of the Master Supply to J1-15 of the ‘First’ Slave Supply (If any).

e) Connect J1-16 of the ‘Last’ Slave Supply to J1-15 of the master Supply (If any).

f) Connect J1-2 (or J1-3) common to all supplies (See Fig. 5.6).

5.15.1.4. Setting Over Voltage Protection

The Master unit OVP setting should be programmed to the desired OVP level. The OVP setting of the slave units should be programmed to a higher value than the Master OVP. When the Master unit shuts down, it programs the Slave unit to zero Output Voltage. If a Slave unit shuts down (when its OVP is set lower than the Master Output Voltage and, if all P/S are not daisy chained per section 3 above), only that Slave unit would shut down, and the remaining Slave units would supply all the load current.

5.15.1.5. Setting Foldback Protection

Foldback protection, is desired, may only be used with the Master unit. When the Master unit shuts down, it programs the Slave units to zero Output Voltage.

5.15.1.6. Connection To The Load

In parallel operation, power supplies can be connected in local or remote sensing. Refer to Fig. 5-4 and 5-5 for typical connections of parallel power supplies. The figures show connection of two units, however the same connection method applies for up to 4 units.

5.15.2. Advanced Parallel Operation

In this method, multiple supplies can be configured to parallel operation as a single power supply. The total load current and output voltage are displayed by the Master unit and can be readback from the Master unit. The Slave units display only their operating status (On, Off or Fault condition).

Refer to the following procedure to configure multiple supplies for Advanced parallel operation.
5.15.2.1. Advanced Parallel Configuration

a) SW1 position 2 - Down in the Master Supply and up in all Slave Supplies.
b) Connect a short between J1-8 and J1-12 in all Slave Supplies.
c) Connect J1-25 of the Master Supply to J1-10 of all Slave Supplies.
d) Connect J1 terminal 23 (IPGM-RTN) of the slave unit to J1 terminal 12 (COM) of master unit.
e) The following set up connections are optional but are strongly recommended. These set up and connections will shut down all the parallel power supplies when fault condition occurs in any one of them.
f) Switch SW1 position 5 should be in its down position for all power supplies (See Fig. 5.6).
g) Connect J1-16 of the Master Supply to J1-15 of the ‘First’ Slave Supply.
h) Connect J1-16 of the ‘First’ Slave Supply to J1-15 of the ‘Second’ Slave Supply (if any)
i) Connect J1-16 of the ‘Second’ Slave Supply to J1-15 of the ‘Third’ Slave Supply (if any)
j) Connect J1-16 of the ‘Last’ Slave Supply to J1-15 of the Master Supply
k) Connect J1-2 (or J1-3) common to all supplies (See fig. 5.6).

5.15.2.2. Connection to the Load

In parallel operation, power supplies can be connected in local or remote sensing. Refer to Fig. 5-4 and 5-5 for typical connections of parallel power supplies. The figures show connection of two units, however the same connection method applies for up to 4 units.

5.15.2.3. Setting the Units as Master or Slave

a) Depress and hold the FINE button for 3 seconds. The Master/Slave configuration will be displayed on the Current Display. Rotate the CURRENT encoder to obtain the desired mode. Refer to Table 5-4 for the CURRENT display and modes of operation.

<table>
<thead>
<tr>
<th>CURRENT Display</th>
<th>Operating Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>H1</td>
<td>Single supply (default)</td>
</tr>
<tr>
<td>H2</td>
<td>Master supply with 1 Slave supply</td>
</tr>
<tr>
<td>H3</td>
<td>Master supply with 2 Slave supplies</td>
</tr>
<tr>
<td>H4</td>
<td>Master supply with 3 Slave supplies</td>
</tr>
<tr>
<td>S</td>
<td>Slave supply</td>
</tr>
</tbody>
</table>

Table 5-4: Setting mode of operation

b) When the desired configuration is obtained, depress and release the FINE button or wait approx. 5 seconds.

5.15.2.4. Master and Slave Units Default Operation

a) When a unit is programmed to Slave mode it enters the Remote mode with Local Lockout. In this mode, the front panel controls are disabled to prevent accidental setting change (refer to Sec. 7.2.7 for details).
b) The Slave unit’s parameters will automatically set the following:
   • Output voltage to approximate 102% of rated output voltage.
   • Programmed Current to zero.
   • UVL to zero volts
   • OVP to its maximum value
   • AST On
   • OUT On
   • Foldback protection Off
c) The Master and Slave modes are stored in the power supply EEPROM when the AC power is turned off. The system will return to the Master/Slave mode upon re-application of AC power.

5.15.2.5. Current Display Accuracy

In the advanced parallel mode, the Master unit calculates the total current by multiplying the Master output current by the number of Slave units. In this method, the CURRENT display accuracy is 2% +/- 1 count. In cases that higher accuracy is required, it is recommended to use the basic parallel operation mode.

5.15.2.6. To Release Units from Slave Mode

Slave units can be released using the following procedure:

a) Depress FINE button for 3 seconds. The Master/Slave configuration will be displayed on the CURRENT display.

b) Select H1 mode using the CURRENT encoder.

c) Depress FINE button again or wait 5 seconds.

d) Turn the AC power Off to store the new setting.

e) After exiting from Slave operation the unit’s parameters will be set to:

- Programmed Voltage to zero
- Programmed Current to zero
- UVL to zero volts
- OVP to its maximum value
- AST OFF
- OUT OFF
- Foldback protection OFF
- Locked Front Panel

f) To unlock the front panel, depress PREView button until the display shows “UFP”.

![Diagram of Parallel Connection with Local Sensing]

Fig.5-4: Parallel connection with local sensing

**CAUTION**

Make sure that the connection between –Vo terminals is reliable to avoid disconnection during operation. Disconnection may cause damage to the power supply.

**NOTE**

With local sensing it is important to minimize the wire length and resistance. Also the positive and negative wire resistance should be close as possible to each other to achieve current balance between power supplies.
CAUTION
Make sure that the connection between –Vo terminals is reliable to avoid disconnection during operation. Disconnection may cause damage to the power supply.

NOTE
1. In parallel operation, the AC Supply should be applied to the Master Unit and then to the slave unit.
2. The above sequence is not required if the units are connected in daisy-chain.

5.16. Daisy-Chain Connection

It is possible to configure a multiple power supply system to shut down all the units when a fault condition occurs in one of the units. When the fault is removed, the system recovers according to its setting to Safe-start or Auto-restart mode.

Setup switch SW1, position 5 should be set to its DOWN position to enable the Daisy-chain operation. Other SW1 positions can be set according to the application requirements.

If a fault occurs in one of the units, its PS_OK signal will be set to a low level and the display will indicate the fault. The other units will shut off and their display will indicate “SO”. When the fault condition is removed, the units will recover to their last setting according to their Safe-start or Auto-restart setting.

Fig.5-6 shows connection of three units, however the same connection method applies to systems with a larger number of units.
5.17. Front Panel Locking

The front panel controls can be locked to protect from accidental power supply parameter change. Press and hold the PREV button to toggle between “Locked front panel” and “Unlocked front panel”. The display will cycle between “LFP” and “UFP”. Releasing the PREV button while one of the modes is displayed, selects that mode.

5.17.1. Unlocked Front Panel

In this mode, the front panel controls are Enabled to program and monitor the power supply parameters.

5.17.2. Locked Front Panel

In this mode the following front panel controls are Disabled:

- VOLTAGE and CURRENT encoders.
- FOLD button.
- OUT button

The power supply will not respond to attempts to use these controls. The VOLT display will show “LFP” to indicate that the front panel is locked.

OVP/ UVL button is active to preview the OVP and UVL setting.

Use the PREV button to preview the Output Voltage and Current setting or to unlock the front panel.
6. REMOTE ANALOG PROGRAMMING

6.1. Introduction

The rear panel connector J1 allows the user to program the power supply Output Voltage and Current with an analog device. J1 also provides monitoring signals for Output Voltage and Output Current. The programming range and monitoring signals range can be selected between 0-5V or 0-10V using the setup switch SW1. When the power supply is in Remote Analog programming, the serial communication port is active and can be used to read the power supply parameters.

**CAUTION**

COM (J1-12), VPGM_RTN (J1-22) terminals are connected and IPGM_RTN (J1-23) terminal of J1 is referenced internally to the -V_{out} potential (-V). Do not connect these terminals to any potential other than -V_{out} (-V), as it may damage the power supply.

6.2. Local/Remote Analog Control

Contact 8 of J1 (Fig.4-2, Item 5) accepts TTL signal or Open-Short contact (referenced to J1-12) to select between Local or Remote Analog programming of the Output Voltage and Current.

In Local mode, the Output Voltage and Output Current can be programmed via the front panel VOLTAGE and CURRENT encoders or via the RS232/RS485 port. In Remote Analog mode, the Output Voltage and current can be programmed by analog voltage or by programming resistors via J1 contacts 9 and 10 (refer to Sections 6.4 and 6.5). Refer to Table 6-1 for Local/Remote Analog control (J1-8) function and Setup switch SW1-1, 2 settings.

<table>

</tr>
</tbody>
</table>

Table 6-1: Local/Remote Analog control function

6.3. Local/Remote Analog Indication

Contact 21 of J1 (Fig. 4-2, Item 5) is an open collector output that indicates if the power supply is in Local mode or in Remote Analog mode. To use this output, connect a pull-up resistor to a voltage source of 30Vdc maximum. Choose the pull-up resistor so that the sink current will be less than 5mA when the output is in a low state. Refer to table 6-2 for J1-21 function.

<table>

6.4. Remote Voltage Programming of Output Voltage and Current Limit

**CAUTION**
To maintain the power supply isolation and to prevent ground loops, use an isolated programming source when operating the power supply via remote analog programming at the J1 connector.

Perform the following procedure to set the power supply to Remote Voltage programming:

a) Turn the power supply AC On/Off switch to Off.
b) Set setup switch SW1-1 to its UP position for output voltage external programming and SW1-2 to its UP position for output current.
c) Set SW1, position 3 to select the programming voltage range according to Table 6-3.
d) Ensure that SW1, positions 7 and 8 are at their DOWN (default) position.
e) Connect a wire jumper between J1-8 and J1-12 (refer to Table 4-4).
f) Connect the programming source to the mating plug of J1 as shown in Fig.6-1. Observe correct polarity for the voltage source.
g) Set the programming sources to the desired levels and turn the power supply ON. Adjust the programming sources to change the power supply output.

**NOTES:**
- SW1, positions, 4, 5, 6 and 9 are not required for remote programming. Their settings can be determined according to the application.
- The control circuits allow the user to set the Output Voltage and Output Current up to 5% over the model-rated maximum value. The power supply will operate within the extended range, however it is not recommended to operate the power supply over its voltage and current rating, and performance is not guaranteed.

Table 6-3: SW1-3 setting and programming range

**J1 connector, rear panel view**

Fig.6-1: Remote voltage programming connection
6.5. Resistive Programming of Output Voltage and Current Limit

For resistive programming, internal current sources, for Output Voltage and/or Output Current control, supply 1mA current through external programming resistors connected between J1-9 & 22 and J1-10 & 23. The voltage across the programming resistors is used as a programming voltage for the power supply. Resistance of 0.5Kohm or 0.10Kohm can be selected to program the output voltage and output current from zero to full scale.

A variable resistor can control the output over its entire range, or a combination of variable resistor and series/parallel resistors can control the output over restricted portion of its range.

Perform the following procedure to set the power supply to Resistive programming:

a) Turn the AC On/Off switch to Off.
b) Set setup switch SW1-1 to its UP position for output voltage external programming and SW1-2 to its UP position for Output Current limit external programming.
c) Set SW1, position 3 to select the programming resistor range according to Table 6-4.
d) Set SW1-7 to its UP position for output voltage resistive programming and SW1-8 to its UP position for Output Current limit resistive programming.
e) Connect a short between J1-8, J1-12 and J1-23 (refer to Table 4-4).
f) Connect the programming resistors to the mating plug of J1 as shown in Fig.6-2.
g) Set the programming resistors to the desired resistance and turn the power supply ON. Adjust the resistors to change the power supply output.

**NOTES:**

- SW1, positions 4, 5, 6 and 9 are not required for remote programming. Their settings can be determined according to the application requirements.
- The control circuits allow the user to set the Output Voltage and Output Current up to 5% over the model-rated maximum value. The power supply will operate within the extended range, however it is not recommended to operate the power supply over its voltage and current rating and performance is not guaranteed.
- To maintain the temperature stability specification of the power supply, the resistors used for programming should be stable and low noise resistors, with temperature coefficient of less than 50ppm.
- When resistive programming is used, front panel and computer control (via serial communication port) of Output Voltage and Current are disabled.

Table 6-4: SW1-3 setting and programming range

Fig.6-2: Remote resistive programming
6.6. Remote Monitoring of Output Voltage and Current

The J1 connector, located on the rear panel provides analog signals for monitoring the Output Voltage and Output Current. Selection of the voltage range between 0-5V or 0-10V is made by setup switch SW1-4. The monitoring signals represent 0 to 100% of the power supply Output Voltage and Output Current. The monitor outputs have 500 ohm series output resistance. Ensure that the sensing circuit has an input resistance of greater than 500 Kohm or accuracy will be reduced.

Refer to Table 6-5 for the required J1 connection, SW1-4 setting and monitoring voltage range.

Table 6-5 Monitoring signals setting

NOTES:

1. Radiated emissions, FCC requirements: FCC requirements for radiated emissions; use shielded cable for the analog control signals. If using unshielded cable, attach an EMI ferrite suppressor to the cable, as close as possible to the power supply.

2. Front panel encoders operation: In Remote analog mode, the output voltage and current can't be set by the VOLTAGE and CURRENT encoders.

3. Front panel PREV button: Use the PREV button to display the Output Voltage and Current setting defined by the encoders or communication

4. Communication: In remote analog mode, all power supply parameters can be programmed and readback via the communication port, except the output voltage and current setting.
7. RS232 & RS485 REMOTE CONTROL

7.1. Introduction

This Chapter describes the operation of the Genesys™ 5000W power supplies via the serial communication port. Details of the initial set-up, operation via RS232 or RS485, the command set and the communication protocol are described in this Chapter.

7.2. Configuration

7.2.1. Default setting

The power supply is shipped with the following settings:

-Address 6
-Baud-rate 9600
-Output Off
-Start up mode Safe-start
-RS232/485 RS232
-OVP Maximum
-Vout setting 0
-UVL 0
-Iout setting Maximum
-Foldback Off
-Master/Slave H1 (Master)
-Front panel: Unlocked (UFP)

7.2.2. Address setting

The power supply address can be set to any address between 0 and 30. Follow the instructions described below to set the unit address.

a) If the unit is in Remote mode (front panel REM/LOC LED illuminated), press the REM/LOC button to put the unit into Local mode.
b) Press and hold the REM/LOC button for approximately 3 sec. The VOLTAGE display will indicate the unit address.
c) Using the VOLTAGE adjust encoder, select the unit address.

To preview the power supply address at any time, press and hold the REM/LOC button for approx. 3 sec. The VOLTAGE display will indicate the power supply address.

7.2.3. RS232 or RS485 Selection

To select between RS232 or RS485 set the rear panel setup switch SW1-6 position to:
− DOWN for RS232
− UP for RS485

7.2.4. Baud Rate Setting

Five optional Baud rates are possible: 1200, 2400, 4800, 9600 and 19200. To select the desired rate, the following steps should be taken:

a) If the unit is in Remote mode (front panel REM/LOC LED illuminates), press the REM/LOC button to put the unit into Local mode.
b) Press and hold the REM/LOC button for approximately 3 sec. The CURRENT display will show the unit Baud Rate.
c) Using the CURRENT adjust encoder, select the desired Baud Rate.

7.2.5. Setting the Unit into Remote or Local Mode

a) The unit will be put into Remote mode only via serial communication command. Commands that will put the unit into Remote mode are:

RST PV n
OUT n PC n
RMT n
(for n values see Tables 7-3 and 7-4)
b) There are two Remote modes:

1. Remote:

   In this mode, return to local can be made by the front panel REM/LOC or via
   serial port command RMT 0. Set the unit into Remote mode via serial port RMT
   1 command.

2. Local Lockout:

   In this mode the unit can be returned to Remote mode via the serial port RMT 1
   command or by turning off the AC power until the display turns off, and then turn
   it to on again. In local Lockout mode, the front panel REM/LOC button is not
   active. Set the unit into Local Lockout mode via serial port RMT 2 command.

7.2.6. RS232/485 Port in Local Mode

When the power supply is in Local mode, it can receive queries or commands. If a
query is received, the power supply will reply and remain in Local mode. If a command
that affects the output is received, the power supply will perform the command and
change to Remote mode.

Serial commands may be sent to set the status registers and read them while the unit is
in Local mode. If the Enable registers are set (refer to Section 7.11) the power supply
will transmit SRQ’s while in Local.

7.2.7. Front Panel in Remote Mode

Front panel control in Remote mode is Disabled except for:

   PREV: use to preview the Voltage and Current setting.
   OVP/UVL: use to preview the OVP/UVL setting.
   LOC/REM: use to set the unit into Local mode.

In Local Lockout mode, only the PREV and OVP/UVL pushbuttons are active.

7.3. Rear Panel RS232/485 Connector

The RS232/RS485 interface is accessible through the rear panel RS232/RS485 IN and
RS485 OUT connectors. The connectors are 8 contact RJ-45. The IN and OUT connectors
are used to connect power supplies in a RS232 or RS485 chain to a controller. Refer to
Fig. 7-1 for IN/OUT connectors.

Fig.7-1: Rear panel J3 IN/OUT connectors pinout

NOTE
Tx and Rx are used for RS232 communication. Txd +/- and Rxd +/- are used for RS485
communication. Refer to RS-232 and RS-485 cabling and connection details.
7.4. Connecting Power Supplies to RS232 or RS485 Bus

7.4.1. Single Power Supply

a) Select the desired interface RS232 or RS485 using rear panel setup switch SW1-6 (Section 4.4).
   - RS232: DOWN position
   - RS485: UP position

b) Connect rear panel IN connector to the controller RS232 or RS485 port using a suitable shielded cable. Refer to Figures 7-2, 7-3 and 7-4 for available RS232 and RS485 cables.

Fig.7-2: RS232 cable with DB25 connector (P/N: GEN/232-25)

Fig.7-3: RS232 cable with DB9 connector (P/N: GEN/232-9)

Fig.7-4: RS485 cable with DB9 connector (P/N: GEN/485-9)
7.4.2. Multi Power Supply Connection to RS232 or RS485 Bus

Up to 31 units can be connected (daisy chained) to the RS232 or RS485 bus. The first unit connects to the controller via RS232 or RS485 and the other units are connected via the RS485 bus.

a) First unit connection: Refer to Section 7.4.1 for connecting the first unit to the controller.

b) Other units connection: The other units on the bus are connected via their RS485 interface.

Refer to Figure 7-5 for typical connection.

- Set rear panel setup switch SW1-6 to its UP position.
- Using the Linking cable supplied with each unit (refer to Fig. 7-6), connect each unit OUT connector to the next unit IN connector.

![Diagram of multiple power supply connections](image)

</tbody>
</table>

**Fig 7-6: Serial link cable with RJ-45 shielded connectors (P/N: GEN/RJ-45)**

**NOTE**

Pins 7 and 8 must not be connected.

Pins 1 through 8 are reversed from the CAT 5 cable standard.

7.5. Communication Interface Protocol

**NOTE**

The address (“ADR n”) command must return an “OK” response before any other commands are accepted.

7.5.1. Data Format

Serial data format is 8 bit, one start bit and one stop bit. No parity bit.

7.5.2. Addressing

The Address is sent separately from the command. It is recommended to add 100msec delay between query or sent command to next unit addressing. Refer to Section 7.7.3 for details.

7.5.3. End of Message

The end of message is the Carriage Return character (ASCII 13). The power supply ignores the Line Feed (ASCII 10) character.
7.5.4. **Command Repeat**

The backslash character "\" will cause the last command to be repeated.

7.5.5. **Checksum**

The user may add a checksum (optional) to the end of the command. The checksum is "$" followed by two hex characters. If a command or a query has a checksum, the response will also have one. There is no CR between the command string and the "$" sign.

Example: STT?3A

STAT?$7B

7.5.6. **Acknowledge**

The power supply acknowledges received commands by returning an “OK” message. If an error is detected the power supply will return an error message. The rules of checksum also apply to the acknowledge.

7.5.7. **Error Message**

If an error is detected in command or query, the power supply will respond with an error message. Refer to Section 7.6 for details.

7.5.8. **Backspace**

The backspace character (ASCII 8) clears the last character sent to the power supply.

7.6. **Error Messages**

The power supply will return error messages for illegal commands and illegal programming parameters. Refer to Table 7-1 for programming error messages and Table 7-2 for command error messages.

**Table 7-1: Programming error messages**

<table>
<thead>
<tr>

7.7. **Command Set Description**

7.7.1. **General Guide**

a) Any command or argument may be in capital letters or small letters.

b) In commands with an argument, a space must be between the command and the argument.
c) For any command that sets a numeric value, the value may be up to 12 characters long.
d) Carriage Return: If the CR character (ASCII 13) is received by itself, the power supply will respond with “OK” and CR.

7.7.2. Command Set Categories

The Genesys™ 5000W series command set is divided into four categories as follows:

1) Initialization control
2) ID control
3) Output control
4) Status control

7.7.3. Initialization Control Commands

<table>
<thead>
<tr>
<th>#</th>

7.7.5. Output Control Commands

<table>
<thead>
<tr>
<th>#</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>PV n</td>
<td>Sets the output voltage value in Volts. The range of voltage value is described in Table 7-3. The maximum number of characters is 12. Examples for PV n format: PV 12, PV 012, PV 12.0, PV 012.00, etc…</td>
</tr>
<tr>
<td>2</td>
<td>PV?</td>
<td>Reads the output voltage setting. Returns the string “n” where “n” is the exact string sent in the PV n command. When in Local mode, returns the PREVIEW (front panel) settings in a 5 digit string.</td>
</tr>
<tr>
<td>3</td>
<td>MV?</td>
<td>Reads the actual output voltage. Returns a 5 digits string. Example: 60V supply sends 01, 150, 15.012, 50.000, etc…</td>
</tr>
<tr>
<td>4</td>
<td>PC n</td>
<td>Sets the Output Current value in Amperes. The range of current values is described in Table 7-4. The maximum number of characters is 12. Examples for PC n format: PC 10, PC 10.0, PC 010.00, etc… See Note 1</td>
</tr>
<tr>
<td>5</td>
<td>PC?</td>
<td>Reads the Output Current setting. Returns the string “n” where “n” is the exact string sent in the PC n command. When in Local mode, returns the PREVIEW (front panel) settings in a 5 digit string.</td>
</tr>
<tr>
<td>6</td>
<td>MC?</td>
<td>Reads the actual Output Current. Returns a 5 digit string. Example: 200A supply sends 000.50, 110.12, 200.00, etc… See Note 2</td>
</tr>
</tbody>
</table>
7.7.5. Output Control Commands-cont.

<table>
<thead>
<tr>
<th>#</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>DVC?</td>
<td>Display Voltage and Current data. Data will be returned as a string of ASCII characters. A comma will separate the different fields. The fields, in order, are: Measured Voltage, Programmed Voltage, Measured Current, Programmed Current, Over Voltage Set Point and Under Voltage Set Point. Example: 5.9999,6.0000,010.02,010.00,7.500,0.000</td>
</tr>
<tr>
<td>8</td>
<td>STT?</td>
<td>Reads the complete power supply status. Returns ASCII characters representing the following data, separated by commas: MV&lt;actual measured voltage&gt; PC&lt;programmed set current&gt; PV&lt;programmed set voltage&gt; SR&lt;status register, 2-digit hex&gt; MC&lt;actual measured current&gt; FR&lt;fault register, 2-digit hex&gt; Example response: MV(45.201),PV(45), MC(4.3257), PC(10), SR(30), FR(00)</td>
</tr>
<tr>
<td>9</td>
<td>FILTER nn</td>
<td>Set the low pass filter frequency of the A to D Converter for Voltage and Current Measurement where nn = 18, 23 or 46.</td>
</tr>
<tr>
<td>10</td>
<td>FILTER?</td>
<td>Returns the A to D Converter filter frequency: 18, 23 or 46 Hz.</td>
</tr>
<tr>
<td>11</td>
<td>OUT n</td>
<td>Turns the output to ON or OFF. Recover from Safe-Start, OVP or FLD fault. OUT 1 (or OUT ON)-Turn On. OUT 0 (or OUT OFF)-Turn Off</td>
</tr>
<tr>
<td>12</td>
<td>OUT?</td>
<td>Returns the output On/Off status string. ON - output On. OFF - output Off.</td>
</tr>
<tr>
<td>13</td>
<td>FLD n</td>
<td>Sets the Foldback protection to ON or OFF. FLD 1 (or FOLD ON) - Arms the Foldback protection FLD 0 (or FOLD OFF) - Cancels the Foldback protection. When the Foldback protection has been activated, OUT 1 command will release the protection and re-arm it, while FLD 0 will cancel the protection.</td>
</tr>
<tr>
<td>14</td>
<td>FLD?</td>
<td>Returns the Foldback protection status string: &quot;ON&quot; - Foldback is armed. &quot;OFF&quot; - Foldback is cancelled.</td>
</tr>
<tr>
<td>15</td>
<td>FBD nn</td>
<td>Add (nn x 0.1) seconds to the Fold Back Delay. This delay is in addition to the standard delay. The range of nn is 0 to 255. The value is stored in eprom at AC power down and recovered at AC power up.</td>
</tr>
<tr>
<td>16</td>
<td>FBD ?</td>
<td>Supply returns the value of the added Fold Back Delay.</td>
</tr>
<tr>
<td>17</td>
<td>FBDRST</td>
<td>Reset the added Fold Back Delay to zero.</td>
</tr>
<tr>
<td>18</td>
<td>OVP n</td>
<td>Sets the OVP level. The OVP setting range is given in Table 7-5 The number of characters after OVP is up to 12. The minimum setting level is approximately 105% of the Output Voltage setting, or the value in Table 7-5, whichever is higher. The maximum OVP setting level is shown in Table 5-1. Attempting to program the OVP below this level will result in an execution error response (&quot;E04&quot;). The OVP setting stays unchanged.</td>
</tr>
<tr>
<td>19</td>
<td>OVP?</td>
<td>Returns the setting &quot;n&quot; where &quot;n&quot; is the exact string in the user’s &quot;OVP n&quot;. When in Local mode, returns the last setting from the front panel in a 4 digit string.</td>
</tr>
<tr>
<td>20</td>
<td>OVM</td>
<td>Sets OVP level to the maximum level. Refer to Table 7-5.</td>
</tr>
<tr>
<td>21</td>
<td>UVL n</td>
<td>Sets Under Voltage Limit. Value of &quot;n&quot; may be equal to PV setting, but returns &quot;E06&quot; if higher. Refer to Table 7-6 for UVL programming range.</td>
</tr>
<tr>
<td>22</td>
<td>UVL?</td>
<td>Returns the setting &quot;n&quot; where &quot;n&quot; is the exact string in the user’s &quot;UVL n&quot;. When in Local mode, returns the last setting from the front panel in a 4 digit string.</td>
</tr>
<tr>
<td>23</td>
<td>AST n</td>
<td>Sets the Auto-restart mode to ON or OFF. AST 1 (or AST ON): Auto restart On. AST 0 (or AST OFF): Auto restart Off.</td>
</tr>
<tr>
<td>24</td>
<td>AST?</td>
<td>Returns the string auto-restart mode status.</td>
</tr>
<tr>
<td>25</td>
<td>SAV</td>
<td>Saves present settings. The settings are the same as power-down last setting. These settings are erased when the supply power is switched Off and the new &quot;last settings&quot; are saved.</td>
</tr>
<tr>
<td>26</td>
<td>RCL</td>
<td>Recalls last settings. Settings are from the last power-down or from the last &quot;SAV&quot; command.</td>
</tr>
<tr>
<td>27</td>
<td>MODE?</td>
<td>Returns the power supply operation mode. When the power supply is On (OUT 1) it will return &quot;CV&quot; or &quot;CC&quot;. When the power supply is Off (OUT 0 or fault shutdown) it will return &quot;OFF&quot;.</td>
</tr>
<tr>
<td>28</td>
<td>MS?</td>
<td>Returns the Master/Slave setting. Master: n = 1, 2, 3, or 4 Slave: n = 0</td>
</tr>
</tbody>
</table>

**NOTES:**
1. In Advanced parallel mode (refer to Sec. 5.15.2), “n” is the total system current.
2. In Advanced parallel mode, “MC?” returns the Master unit current multiplied by the number of slave units +1.
7.8. Global Output Commands

7.8.1. Description

Global commands are a way to quickly set all power supplies on the RS-232/485 bus to the same setting. For example, sending "GOUT OFF" is one way to turn a whole group of supplies OFF at nearly the same time.

NOTE
After sending a global command, it is important that the controller wait 200 mSec before sending any more RS-232/485 messages.

If the command contains an error, such as incorrect syntax or range values, NO error response will be returned by any power supply.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
</table>
| 1. | GRST | Reset. Brings the power supply to a safe and known state:
|    |   | Output voltage: 0V, output current: 0A, OUT: Off, Remote: RMT 1, OVP: Max, UVL: 0.
|    |   | The conditional register (FLT and STAT) are updated. Other registers are not changed.
|    |   | Non-Latching faults (FB, OVP, SO) are cleared. OUT fault stays.
| 2. | GPV n | Sets the output voltage value in volts. The range of voltage values is shown in Table 7-3. ‘n’ may be up to 12 char plus dec. pt
| 3. | GPC n | Program the output current value in amperes. The range of current values is shown in Table 7-4. ‘n’ may be up to 12 char plus dec. pt
| 4. | GOUT | Turns the output to ON or OFF:
|    |   | “OUT 1/ON” = turn on
|    |   | “OUT 0/OFF” = turnoff, clears CV and CC bits in the Status Condition (STAT).
|    |   | OUT ON will respond with “E07” if the output cannot be turned on because of a latching fault (OTP< AC, ENA, SO) shutdown.
| 5. | GSAV | Save present settings. Same settings as power-down last settings listed in section 5.13.
|    |   | These settings are erased when the supply power is switched off and the new ‘last settings’ are saved.
| 6. | GRCL | Recall last settings. Settings are from last power-down or from last ‘SAV’ or ‘GSAV’ command. Address and Baud rate are not recalled so communication is not interrupted.

**NOTE**
The power supply can accept values higher 5% than the table values, however it is not recommended to program the power supply over the rated values.

### 7.9. Fast Queries

These are commands that read a response very quickly from the power supply. They use unprintable character codes. They allow the power supply to avoid the normal command processing delays.

The processing time for these queries is typically 2 mSec, so total query speed is 2 mSec plus the RS-232/485 transmission time.

Since these queries embed the power supply address (0 to 30), there is no need to first send the “ADR n” addressing command.

#### 7.9.1. Fast Test for Connection

This is an addressed query that is good for scanning to see what supplies are “on line”. If no response is returned within 10 mSec, your control program has determined that no power supply is connected at that address.
Query Format:
Send two bytes of unreadable characters. First:
Byte 1 = 1010 1010 = AA hex
Byte 2 = 000x xxxx  (where xxxx is the address of the supply in binary)

Query Response:
The power supply returns 5 characters:
First a “1” = 31 hex if Multi-drop is enabled
or a “0” = 30 hex if Multi-drop is not enabled
Then four printable characters:
Dollar sign “$”
Checksum (two ASCII hex characters) = “30” or “31”
Carriage-return terminator

7.9.2. Fast Read Registers
This query allows fast polling of the status and error registers for many power supplies
on a RS-232/485 link. It is useful for checking many supplies to verify they are all
operating as expected.

Query Format:
Send two bytes of unreadable characters. First:
100x xxxx  (where xxxx is the address of the supply in binary)
And send it a second time:
100x xxxx  (send 2 characters sequentially)

Query Response:
The power supply returns 16 characters including the contents of the status and
fault registers (see section 7.11 and Figure 7-7).
First twelve bytes contain binary data from six registers:
Then four printable characters:
Dollar sign “$”
Checksum (two ASCII hex characters)
Carriage-return terminator

7.9.3. Read Power-On Time
This query allows you to read how many minutes the power supply has been running
since it was built. The accuracy, in minutes, is not guaranteed for time critical
applications.

Query Format:
Send two bytes of unreadable characters. First:
Byte 1 = 1010 0110 = A6 hex
Byte 2 = 000x xxxx  (where xxxx is the address of the supply in binary)

Query Response:
The power supply returns 12 characters:
First is the minutes as a 32 Bit integer as 8 ASCII Hex bytes
Then four printable characters:
Dollar sign “$”
Checksum (two ASCII hex characters) = “30” or “31”
Carriage-return terminator
7.9.4. Service Request Messages

A Genesys power supply can automatically send messages over the RS-232/485 lines when there is a change in operating mode or if a fault occurs. These messages are called Service Requests or SRQs. They are setup with the RS-232/485 status registers (see section 7.10 and 7.11).

Since the SRQ messages may be sent from any supply at any time, there is a chance they can collide with other messages from other supplies. Your controller software has to be developed enough to read messages that may come at any time, and to recover if messages are corrupted by collisions.

If you need Service Request messaging, please contact TDK-Lambda for assistance. We can provide several special communication commands and settings that will help with this.

7.10. Status and Error Commands

The following commands operate on the power supply status and error registers. They are used to read operating conditions and fault conditions, they can be set to latch changes in these conditions, and masks can be set up to send service requests messages if the conditions change.

Refer to the next section for more instructions.

</tbody>
</table>
7.11. Status, Error, and SRQ Registers

7.11.1. General Description

This Section describes the structure and operation of the six status, error, and SRQ registers. The registers can be set or read via the RS232/RS485 commands.

Refer to Fig. 7-7 for the Status and Error Registers Diagram.

NOTE

These registers operate in a way that is similar to the IEEE-488 and SCPI registers (as used by the Genesys™ with the "-IEMD" option), but the structure and command set is different.

---

Fig. 7-7: Status and Error Registers Diagram
7.11.2. Conditional Registers

The fault Condition Register and the Status Condition Register are read only registers that the user may read to see the condition of the Power supply. Refer to Table 7-7 for description of the Fault Condition Register bits and Table 7-8 for the Status Condition register bits.

7.11.3. Service Request: Enable and Event Registers

The conditional Registers are continuously monitored. When a change is detected in a register bit which is enabled, the power supply will generate an SRQ message.

The SRQ message is: “nn” terminated by CR, where the nn is the power supply address. The SRQ will be generated either in Local or Remote mode.

Refer to Tables 7-9 to 7-12 for details of the Enable and Event registers.

7.11.3.1. Fault Enable Register (FENA nn, FENA?)

The Fault Enable Register is set to the enable faults SRQs.

</table>
### 7.11.3.3. Status Enable Register

The Status Enable Register is set by the user to Enable SRQs for changes in power supply status.

**Table 7-11: Status Enable Register (SENA nn, SENA?)**

<table>
<thead>
<tr>

### 7.11.3.4. Status Event Register

The Status Event Register will set a bit if a change in the power supply status occurs and it is enabled. The register is cleared when the “SEVE?” or “CLS” commands are received. A change in this register will generate SRQ.

**Table 7-12: Status Event Register (SEVE?)**

7.12. Serial Communication Test Set-Up

Use the following instructions as basic set-up to test the serial communication operation.

### 7.12.1. Equipment:

PC with Windows Hyper Terminal, software installed, Genesys™ Power supply, RS232 cable.

### 7.12.2. PC set-up:

A. Open Hyper Terminal…………… New Connection.
B. Enter a name
C. Connect to………………………... Direct to Com 1 or Com 2
D. Configure port properties:
   - Bits per second......9600
   - Data bits………..8
   - Parity……………..None
   - Stop bits…………..1
   - Flow control……….None
E. Open Properties in the program File………………….Properties
F. Setting: ASCII Set Up
   - Select Echo characters locally, select send line ends with line feed.
   - On some PC systems, pressing the number keypad “Enter” will distort displayed messages. Use the alphabetic “Enter” instead.

### 7.12.3. Power supply set-up:

A. Connect the power supply to the PC using the RS232 cable.
B. Set via the front panel: Baud Rate: 9600, Address: 06 (default).
C. Set via the rear panel: RS232/RS485 to RS232 (refer to Section 4.4).

### 7.12.4. Communication Test:

A. Select a power supply at address 6:
   - PC: write: ADR 06
   - Power supply response: OK
B. Command test:
   - PC write: OUT 1
   - Power supply response: OK
   - PC write: PV 5.0
   - Power supply response: OK
   - PC write: PC 1.0
   - Power supply response: OK

The power supply should turn on and the display will indicate the actual Output Voltage and the actual Output Current.
8. ISOLATED ANALOG PROGRAMMING OPTION

8.1. Introduction

Isolated Analog Programming is an internal Option Card for analog programming of the Genesys™ power supply series. The option is factory installed and cannot be obtained with a GPIB (IEEE-488) Interface. Output Voltage and Output Current can be programmed and readback through optically isolated signals which are isolated from all other ground references in the power supply.

There are two types of Isolated Analog programming cards:

a) 0-5V/0-10V option (PN: IS510): Using 0-5V or 0-10V signals for programming and readback.

b) 4-20mA option (PN: IS420): Using current signals for programming and readback.

8.2. Specifications

8.2.1. 0-5V/0-10V Option (PN: IS510)

8.3. **Isolated Programming & Monitoring Connector**

Refer to Table 8-1 for detailed description of the rear panel Isolated Programming & Monitoring connector. To provide the lowest noise performance, it is recommended to use shielded-twisted pair wiring.

Refer to Fig.8-1 for description of the Isolated Analog Programming & Monitoring connector.

Isolated programming plug P/N: MC1.5/8-ST-3.81, Phoenix.

**CAUTION**

When the Isolated Analog Option is installed, do not apply any signals to the non-isolated VPGM and IPGM (J1-9 and J1-10) pins. All other J1 features may be used normally. Refer to Section 4.5 for a description of J1 features.
8.4. Setup and Operating Instructions

**CAUTION**

To prevent damage to the unit, do not program the output voltage and current to higher than the power supply rating.

8.4.1. Setting up the power supply for 0-5V/0-10V Isolated Programming and Monitoring

Perform the following procedure to configure the power supply:

a) Turn the power supply AC power switch to Off.
b) Connect a wire jumper between J1-8 and J1-12 (refer to Table 4-4).
c) Set the Setup switch SW1, positions 1 and 2 to the UP position.
d) Set SW1, position 3 to select the Programming Voltage Range: Down=0-5V, Up=0-10V.
e) Set SW1, position 4 to select the Monitoring Range: Down=0-5V, Up=0-10V.
f) Ensure that SW1 positions 7 and 8 are in the Down position.
g) Connect the programming sources to the mating plug of the Isolated Programming connector. Observe for correct polarity of the voltage source.

**NOTE**

J1-8 and J1-12 must be shorted together with a wire jumper.

h) Set the programming sources to the desired levels and turn the power supply ON.

8.4.2. Setting Up the Power Supply for 4-20mA Isolated Programming and Monitoring

Perform the following procedure to configure the power supply:

a) Turn the power supply AC power switch to Off.
b) Connect a wire jumper between J1-8 and J1-12 (refer to Table 4-4).
c) Set the Setup switch SW1, positions 1 and 2 to the Up position.
d) Set SW1, position 3 to the Up position.
e) Set SW1, position 4 to the Up position.
f) Ensure that SW1 positions 1 and 2 to their Up position.
g) Connect the programming source to the mating plug of the Isolated Programming connector. Observe for correct polarity of the voltage source.

**NOTE**

J1-8 and J1-12 must be shorted together with a wire jumper.

h) Set the programming sources to the desired levels and turn the power supply ON.

**NOTE**

SW1 position 3 and 4 must be in the Up position for operation with 4-20mA Isolated Programming and Monitoring.
9. MAINTENANCE

9.1. Introduction

This Chapter provides information about maintenance, calibration and troubleshooting.

9.2. Units Under Warranty

Units requiring repair during the warranty period should be returned to a TDK-Lambda Americas Inc authorized service facility. Refer to the addresses listing on the back cover of this User’s Manual. Unauthorized repairs performed by other than the authorized service facilities may void the warranty.

9.3. Periodic Maintenance

No routine maintenance of the power supply is required except for periodic cleaning. To clean, disconnect the unit from the AC supply and allow 30sec. For discharging internal voltages. The front panel and the metal surfaces should be cleaned using a mild solution of detergent and water. The solution should be applied onto a soft cloth, and not directly to the surface of the unit. Do not use aromatic hydocarbons or chlorinated solvents for cleaning. Use low pressure compressed air to blow dust from the unit.

9.4. Adjustments And Calibration

No internal adjustment or calibration is required. There is NO REASON to open the power supply cover.

9.5. Parts Replacement And Repairs

As repairs are made only by the manufacturer or by authorized service facilities, no parts replacement information is provided in the manual. In case of failure, unusual or erratic operation of the unit, contact a TDK-Lambda Americas Inc. sales or service facility nearest you. Please refer to the TDK-Lambda Americas Inc. sales offices addresses listing on the back cover of this User's Manual.

9.6. Troubleshooting

If the power supply appears to be operating improperly, use the Troubleshooting Guide (Table 9-1) to determine whether the power supply, load or external control circuit are the cause.

Configure the power supply for basic front panel operation and perform the tests of Section 3.8 to determine if the problem is with the supply.

Table 9-1 provides the basic checks that can be performed to diagnose problems, with references to Sections of this User's Manual for further information.

### 9.7. Fuse Rating

There are no user replaceable fuses in the power supply. Internal fuses are sized for fault protection and if a fuse was opened, it would indicate that service is required. Fuse replacement should be made by qualified technical personnel. Refer to Table 9-2 for a listing of the fuses.

**Table 9-2: Internal fuses**
